**SITE ASSESSMENT,
REMEDIATION &
REVITALIZATION**

Dear Ms. Walker:

On behalf of our client Lennox International Inc. (Lennox), EarthCon Consultants, Inc. (EarthCon) is submitting the enclosed Assessment Report for the former Ducane Company Site located in Blackville, Barnwell County, South Carolina (BLWM File # 401356). This report is being submitted in accordance with the requirements of Voluntary Cleanup Contract 16-5848-RP executed on November 17, 2016. Due to the visual nature of Plume Analytics™, we would like to arrange a meeting with you to present the results of the Plume Analytics™ study prior to your final review of the enclosed report.

Please free to call us at (770) 973-2100 if you have any questions or if we can provide any additional information.

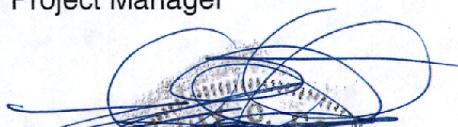

Respectfully submitted,
EARTHCONE CONSULTANTS, INC.

A handwritten signature in blue ink that appears to read "Carol Northern".

Carol D. Northern
Project Manager

A handwritten signature in blue ink that appears to read "David Richardson".

David Richardson, P.G. (SC#2084)
Principal Geologist

A handwritten signature in blue ink that appears to read "Timothy O. Goist".

A circular, faint stamp containing the text "TIMOTHY O. GOIST" around the perimeter and "P.G." in the center. In the center of the stamp, there is handwritten text that appears to read "3.24.17".

Cc: Mr. Mark Yohman, Director of Environmental Affairs, Lennox International, Inc.

This Assessment Report for the Former Ducane Company Site, located in Blackville, Barnwell County, South Carolina (BLWM File #401356) is being submitted to satisfy the requirements of Voluntary Cleanup Contract 16-5848-RP executed on November 17, 2016. Groundwater sampling and a Plume Analytics™ study were conducted as described in the Work Plan dated December 9, 2016 and approved by the South Carolina Department of Health and Environmental Control (SCDHEC) on December 29, 2016. This report presents the results of the groundwater sampling and Plume Analytics™ study and provides an interim groundwater monitoring plan and recommendations for additional activities.

1.0 GROUNDWATER SAMPLING

The former Ducane Company Site is located at 118 West Main Street in Blackville, South Carolina (Figure 1). The facility property consists of approximately 105 acres with approximately 19 acres developed with a production building and a research and development building. The property is identified by Barnwell County as consisting of three parcels. One parcel is owned by the Barnwell County Economic Development Corporation. The other two parcels, which include the buildings, are owned by NK Newlook, Inc. and were formerly used for production of wooden commercial display cabinets. The property is currently vacant. Assessment and remediation activities have been ongoing at the Site since 1999. Constituents detected in Site soils and groundwater included chlorinated volatile organic compounds (CVOCs) and petroleum hydrocarbons. Approximately nine in-situ chemical oxidation/bio-remediation injection events were performed at the Site from July 2003 to April 2008.

There are 19 groundwater monitoring wells located at the Site (Figure 2). In October 2014, groundwater samples were collected by others from 15 of the monitoring wells and analyzed for volatile organic compounds (VOCs). It was reported that at that time, monitoring wells MW-5 and MW-9 were not sampled due to access restrictions while wells MW-12 and MW-13 were not accessible due to high water levels caused by a beaver dam.

On November 17, 2016, Lennox International (Lennox) entered into a Voluntary Cleanup Contract 16-5848-RP (the Contract) with the SCDHEC. Section 3A of the Contract required Lennox to perform a comprehensive round of groundwater sampling at all wells and analyze for VOCs to update the plume status. Additionally, Section 3A required analysis of TAL metals from monitoring wells MW-1, MW-3 and a background well using low-flow purge and sampling techniques. The following sections describe the field activities conducted to address these requirements and present the results of the analyses.

1.1 *Field Activities*

A groundwater sampling event was conducted at the Site from January 30 to February 2, 2017. Prior to sampling, the wells were located and the condition of each well was evaluated. Three of the 19 monitoring wells at the Site, MW-8, MW-12 and MW-13, could not be located. Although

monitoring well MW-9 was visually observed, it is located on private property and permission to access this well was not obtained. The locations of the monitoring wells are shown on Figure 2.

Static water levels and total well depths were measured on January 30, 2017 from the 15 located wells. The monitoring well construction details, including total well depths measured on January 30, 2017, are presented in Table 1 and the water level measurements are presented in Table 2. A water level could not be measured at well MW-2 due to what appeared to be artesian conditions causing water to flow out of the well. Once this condition was observed the well cap was reinstalled to prevent the free-flowing water.

Groundwater samples were collected from 15 of the 19 wells using low flow purge and sampling techniques. Wells MW-8, MW-12, MW-13 could not be located and permission to sample well MW-9, which is located on adjacent private property, was not obtained. Prior to sampling, each well was purged and the field parameters temperature, specific conductance, dissolved oxygen (DO), oxidation reduction potential (ORP), ferrous iron and turbidity were measured. A description of the field procedures is provided in Appendix A. Field parameters measured during the sampling event are summarized in Table 3 and the field sampling forms are provided in Appendix B.

1.2 Groundwater Flow

The water level measurements collected on January 30, 2017 (Table 2) were used to develop a potentiometric surface map for the Site. As shown on Figure 3, groundwater elevation data indicate groundwater flow to the northwest. This is consistent with groundwater flow presented in the *Ground Water and Soil Assessment Report*, dated January 2013.

1.3 Groundwater Analytical Results

Groundwater samples were analyzed for VOCs using EPA Method 8260 and 1,4-dioxane using EPA Method 8260 SIM. The groundwater samples were also analyzed for the monitored natural attenuation (MNA) parameters nitrate, sulfate, sulfide, chloride, alkalinity, total organic carbon (TOC) and dissolved gases (methane, ethane, ethene). In addition, groundwater samples from wells MW-1, MW-3 and MW-6R were analyzed for TAL metals.

A summary of the VOC analyses is provided in Table 4, the TAL metals results are summarized in Table 5 and the MNA parameter results are summarized in Table 6. The laboratory analytical reports from Shealy Environmental Services, Inc. (DHEC Certification No. 32010) are provided in Appendix C. Due to elevated reporting limits caused by dilutions during laboratory analyses, J-flag values were included in Table 4.

As shown in Table 4, concentrations of VOCs were not detected above the practical quantitation limit (PQL) in groundwater samples collected from downgradient wells MW-10, MW-11 and MW-14 and upgradient wells MW-15 and MW-6R. VOCs were not detected at concentrations above their respective US EPA maximum contaminant levels (MCLs) in groundwater samples collected

from downgradient wells MW-2, and MW-4 or from wells MW-1D, MW-2D and MW-3D screened in the deeper zone. Additionally, the concentration of tetrachloroethene (PCE) in the groundwater sample collected from deep well MW-4D is 5.3 micrograms per liter ($\mu\text{g/l}$) which is only slightly above its MCL of 5.0 $\mu\text{g/l}$.

As shown in Table 4, concentrations of 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), PCE, trichloroethene (TCE), and/or vinyl chloride (VC) were detected at concentrations above their respective MCLs in samples collected from wells MW-1, MW-3, MW-5 and/or MW-7. Additionally, concentrations of 1,1-dichloroethane (1,1-DCA) and 1,4-dioxane were detected at concentrations above their respective US EPA Regional Screening Levels (RSL) for Tap Water in wells MW-3 and MW-5. A summary of historical results is provided in Appendix D.

As shown in Table 5, except for iron concentrations (and possibly sodium). TAL metals in wells MW-1 and MW-3 are generally similar to or less than those in background well MW-6R. The elevation of iron in MW-1 and MW-3 is likely due to the zero valent iron injected during a previous ABC Plus injection event in the area of those wells. Based upon a review of the TAL metals concentrations there does not appear to be any concerns or a reason to continue sampling for metals at the Site.

2.0 PLUME ANALYTICS™

EarthCon conducted a Plume Analytics™ Services (Plume Analytics™) Evaluation, including a Ricker Method® Plume Stability Analysis for the upper shallow aquifer at the Site using groundwater analytical data provided by Environmental Resources Management (ERM) through 2014 and analytical data collected by EarthCon in 2017. The Plume Analytics™ evaluation was conducted for the following constituents of concern (COC):

Chloroethenes

- Tetrachloroethene (PCE)
- Trichloroethene (TCE);
- cis-1,2-Dichloroethene (cis-1,2-DCE);
- trans-1,2-Dichloroethene (trans-1,2-DCE);
- 1,1-Dichloroethene (1,1-DCE);
- Vinyl chloride; and
- Total chloroethenes (molar)

Chloroethanes

- 1,1,1-trichloroethane (1,1,1-TCA);
- 1,1,2-trichloroethane (1,1,2-TCA)
- 1,1-dichloroethane (1,1-DCA);
- 1,2-dichloroethane (1,2-DCA); and
- Total chloroethanes (molar)

Aromatic Hydrocarbons

- Toluene
- Ethylbenzene
- Xylenes

This Plume Analytics™ evaluation included the following elements:

- Ricker Method® Plume Stability Analysis;
- Total molar trend and molar ratio analysis for chloroethenes and chloroethanes;
- Plume difference over time evaluation (aka Spatial Change Indicator™ evaluation); and
- Geochemical MNA isopleths (ethene, ethane, methane, etc.).

The plume stability analysis is performed using procedures described in *A Practical Method to Evaluate Ground Water Contaminant Plume Stability* (Ricker, 2008). The Ricker Method® plume stability analysis compares relative changes in contaminant plume characteristics over time, including area, average concentration, and mass indicator. Note that the term “mass indicator” does not necessarily represent the entire mass in the subsurface, but rather an expression of it based on a fixed assumption of aquifer thickness and porosity. Calculation of the actual plume mass is often a very complicated exercise and typically more data/inputs are needed than are available from typical delineation and/or remediation well information. Because the plume mass value is not necessarily an indication of actual contaminant mass, the term “mass indicator” is used to describe this plume characteristic.

To demonstrate that a plume is decreasing or stable, temporal changes in these calculated values should result in an overall decreasing or stable trend. An increasing trend in any of these values may indicate that the plume is not stable and/or is possibly expanding.

The center of plume mass and plume spread are also calculated. Evaluation of center of mass movement should be considered in conjunction with the other plume characteristics. For example, a stable or decreasing plume may actually show migration of center of mass in the downgradient direction in instances when focused remediation occurred in a source area of a site. In this case, this downgradient shift is due to the rapid loss of mass in the upgradient portion of the plume, as opposed to a gradual migration resulting from advective transport.

In addition to the metrics described above, CVOC groundwater data is also evaluated on a molar basis for both total chloroethenes and total chloroethanes. To evaluate the CVOC plumes on a molar basis, the total moles of the plume as well as the molar ratio of each constituent to the total are calculated. It is known that during reductive dechlorination, a parent compound degrades to a daughter compound resulting in a reduction of total CVOC mass due to the loss of one chlorine atom. However, the number of moles does not decrease since one molecule of a parent compound (e.g., PCE) produces one molecule of its respective daughter compound (e.g., TCE). The total moles only decrease once the parent constituent has been completely mineralized to benign end products (i.e., carbon dioxide, water, and chloride ions). Additionally, once a parent compound is reduced to a daughter product, the molar ratio of the parent compound to the total moles decreases. Therefore, the trend of total moles of a plume is better evaluated by calculating the moles of each species and the resulting total moles of the entire degradation series. A decreasing total moles trend provides evidence of complete mineralization of CVOC compounds. Conversely, an increasing total moles trend might indicate potential new or episodic releases within a plume. Also, observing the molar ratios of the individual constituents along with the trend

in total moles can provide further insight into various attenuation processes that may be occurring on the Site. For example, a decreasing trend in total moles with an increasing ratio of daughter (i.e. cis-1,2-DCE) to parent (i.e. TCE) constituents may indicate the presence of biological reductive dechlorination. Whereas a decreasing trend in total moles with individual constituent ratios that remain relatively constant may indicate the occurrence of non-selective destructive processes such as abiotic chemical reduction, anthropogenic recovery or others.

Spatial differences in constituent concentrations over time were also evaluated. Through the Spatial Change Indicator™ process, spatial difference maps (or “plume difference maps”) were prepared that illustrate where concentrations increase or decrease between two sample events. Each spatial plume difference map depicts the location and relative magnitude where the dissolved constituent plume differed between the two sampling events. Areas of red and blue shading indicate areas of concentration increase and decrease, respectively.

2.1 Data Assessment and Input File Development

Data used in the Ricker Method® plume stability analysis for the constituents listed above for the upper shallow aquifer at the Site are included in Table 1 of Appendix E. Groundwater analytical data provided to EarthCon from Lennox and their previous consultant ERM, showed that the monitoring well network and monitoring frequency at the Site varied over a period from approximately 1999 through February 2017. Sampling events occurred at varying frequencies with annual monitoring in 1999 and 2000, semi-annual monitoring from 2001 through 2010, and three monitoring events conducted since 2010 (2012, 2014, and Feb-2017). Not all monitoring points were sampled during each sampling event, and sampling gaps were filled by either interpolating between those events with available data or by extrapolating prior to or subsequent to events with available data. Other scientific and/or statistical assumptions and adjustments to the data, consistent with the Ricker Method®, were necessary to complete the analysis. These adjustments are identified in the Ricker Method® input data set summarized in Table 1 of Appendix E. The assumptions and adjustments used in the analysis include the following:

- Monitoring points in which 100 percent of the data were non-detect for a particular constituent were assumed always to be non-detect for that constituent, even during sampling events when no analytical data were reported. Instances where these non-detect values are assigned are indicated by purple shading in Table 1 of Appendix E.
- In most cases, non-detect concentrations were evaluated with an assigned concentration value of one-half of the stated detection limit. Also, in cases where non-detect concentrations with elevated detection limits were encountered, professional judgment was used. For example, in some cases, the actual elevated detection limit value is used, in others a fraction of the value is used, and in some cases it is assigned non-detect at the standard detection limit. In every case the assigned value was based on actual results (detectable value or non-detect at a lower detection limit) from other sampling events in the same well or in nearby wells.

- For sampling events where a particular monitoring point was not sampled but analytical data prior to and subsequent to are available, the events were assigned values by interpolating between the closest prior and subsequent sampling event. Instances where these values are assigned are indicated by orange shading in Table 1 of Appendix E.

2.2 Groundwater Plume Map Development

COC concentration isopleth maps were developed for the period of September 1999 through February 2017. Plume maps were created using procedures discussed above for each COC in the upper shallow aquifer. COC concentration isopleth maps, or plume maps, for each COC were delineated to concentration limits of 5.0 µg/l or to the applicable MCL. In some instances, the plume map was delineated to 5.0 µg/l and a secondary boundary representing the MCL was also included in the plume map animation if the MCL was above 5.0 µg/l.

The area of the COC-specific plume for each year was calculated using the mathematical features of the contouring software used to develop the isopleth maps (i.e., Surfer® by Golden Software, Inc.). The kriging gridding method was used with the default linear variogram to develop the isopleth maps. Surfer® was also used for the computation of the average concentration of each plume, as described in Ricker (2008). The plume area and average concentrations were then used to calculate the plume mass indicator for each year. To calculate the plume mass indicator, a value for porosity of 30% was used. An assumed aquifer thickness of 10 feet was also used based on most well screen lengths installed in the shallow aquifer.

Plume map videos for each of the COCs are included in Attachment 1 to Appendix E. As discussed above, plume stability characteristics were calculated for each of the sampling events included in the analysis. The plume stability characteristics of area, average concentration, and mass indicator, as well as the location of the center of mass, are shown on each plume map.

2.3 Statistical Methodology

To evaluate the stability of each constituent plume, temporal trends of the characteristics for each plume were evaluated statistically. The area, average concentration, and mass indicator for each year were initially plotted to observe changes in each parameter from event to event. The results of the plume stability analyses for each constituent are discussed further below in Section 2.5.

The temporal trends in the plume characteristic values were statistically evaluated using both linear regression techniques and the Mann-Kendall Test. Linear regression analyses were conducted using the regression analysis utility in Microsoft Excel. The Mann-Kendall Tests were also conducted using Microsoft Excel spreadsheets based on procedures described in Gilbert (1987). Linear regression is a parametric statistical procedure that is typically used for analyzing trends in data over time. The Mann-Kendall Test is a non-parametric statistical test; therefore, it is not dependent upon the magnitude of the data, assumptions of distribution, or regularly spaced sampling events.

The Mann-Kendall Test is used to assess whether a data set exhibits an increasing or decreasing trend, at a predetermined level of significance, α . The test requires the calculation of a statistic "S", which is the difference between the number of paired differences that are positive, minus the number that are negative. If S is a large positive value, then there is evidence of an increasing trend in the data. If S is a large negative value, then there is evidence of a decreasing trend in the data. The null hypothesis, H_0 , for the Mann-Kendall Test is that there is no temporal trend in the data. The alternative hypothesis, H_A , is that of either an upward trend or a downward trend.

If the null hypothesis is not rejected (i.e., no trend could be established statistically), it is expected that the plume is stable. However, a stable plume may not in fact be evident because the statistical test does not take into account magnitude or variation in the data. For example, a data set can exhibit a large amount of scatter, yet the test could conclude that the plume is stable. A methodology to counter the problem of scatter in the data involves comparing the calculated S statistic, a calculated confidence factor ($1-\alpha$), and the coefficient of variation for the data set. The S statistic indicates the direction of the trend, the confidence factor shows how strong the trend is, and the coefficient of variation indicates the degree of scatter in the data.

When evaluating trends using linear regression, trends may be obscured by scatter in the data. This condition is typically indicated by a low coefficient of determination (R^2) value. Even with low R^2 values (i.e., high degree of scatter), a confidence interval can still be constructed on the slope of the regression line. As described in AFCEE (2006), assuming the sign (i.e., positive or negative) of the estimated log-slope is correct, a level of confidence that the slope is not zero can be easily determined. The overall trend in the data may thus still be determined, where low levels of confidence correspond to stable or indeterminate trends and higher levels of confidence (e.g., > 90%) indicate the stronger likelihood of a trend.

For the plume stability analysis, significant trends are established when the calculated confidence factor is greater than 90%. If the confidence factor is less than 90%, the plume is considered stable if the coefficient of variation is small (i.e., <1). If the coefficient of variation is high (i.e., >1), then a conclusion of indeterminate trend is made.

In many cases, the statistical results for both linear regression and Mann-Kendall Test agree with each other. In the case where two different results are obtained (e.g., one stable trend and one decreasing trend), visual analysis and professional judgment are used to determine the overall trend result.

For the purposes of this evaluation we were most interested in the trends of each COC since the last remediation event which reportedly occurred in April 2008. By doing so we are able to observe the relative stability of the plume since that last remedial event. As such, each trend analysis described herein starts at April 2008 and continues through the February 2017 sampling event. The trends for each COC over this time period are summarized below in Section 2.5 and are also shown in Attachment 1 to Appendix E.

2.4 Spatial Change Indicator™ Methodology

The Spatial Change Indicator™ evaluation (patent pending) shows relative changes in the plume over time. For this analysis, each plume map in a particular time period is compared to the first plume map in the series. In essence, the current plume is subtracted from the original plume to create a new isopleth map that shows areas of the plume that decreased in concentration (indicated by blue shading), increased in concentration (indicated by red shading), or did not change (indicated by clear or no shading). The visual aspect of this analysis allows the viewer to observe patterns of plume behavior over time.

This analysis also has a quantitative component. Each Spatial Change Indicator™ map also shows the percent change (increase or decrease) of the plume between the two events in terms of area, average concentration, and mass indicator. Additionally, for areas that increased or decreased in concentration, a representative mass is calculated using Ricker Method® procedures. That is, the magnitude of mass increase (red shaded areas) and mass decrease (blue shaded areas) is also shown on each map. The full Spatial Change Indicator™ analysis is included in Attachment 1 to Appendix E.

2.5 Plume Analytics™ Results

One of the primary benefits of the Plume Analytics™ process is the conversion of data into graphical and video outputs that make data more understandable. As such, we highly recommend that a meeting be convened with SCDHEC that will allow for the presentation of the graphical and visual animations of the data which will provide better context for the information reported herein. The following is provided as a textual summary of the visual outputs.

A Ricker Method® Plume Stability Analysis was conducted for the Site using groundwater data for each of the constituents from 1999 to 2017. However, throughout Site history, numerous remedial efforts and monitoring well installations were performed. April 2008 is significant because it marks the end of all remedial activity for the Site. Due to the various remedial efforts and monitoring well network expansions prior to April 2008, statistical trends were performed on the data from September 2008 through February 2017. This date range was chosen to provide insight into current plume behavior and any lasting effects of previous remedial activities. Due to the lack of delineation of the plume to the north of MW-3, the analysis was conducted inside a prescribed “window” of the plume. This plume window is defined by the lateral extents of the monitoring well network and therefore the plume contours were truncated at the boundary of the window.

As mentioned above, a Ricker Method® plume stability analysis was conducted on each COC. The following table summarizes the plume stability trends since April 2008 of area, average concentration, and mass indicator for each of the COCs. The individual trends for area, average concentration, and mass indicator as well as spread for each constituent are included in Figures 1 through 19 of Appendix E.

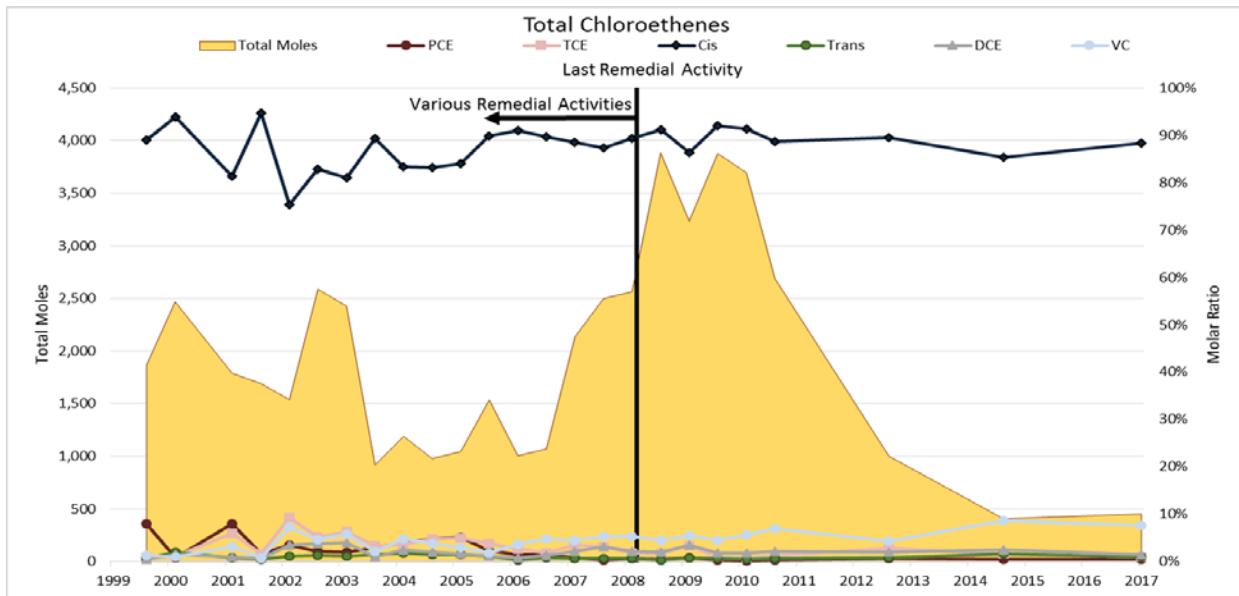

Constituent	Area	Average Concentration	Mass Indicator
Total Chloroethenes	No Trend	Decreasing	Decreasing
PCE	No Trend	Decreasing	Decreasing
TCE	No Trend	Decreasing	Decreasing
Cis-1,2-DCE	Decreasing	Decreasing	Decreasing
Trans-1,2-DCE	Decreasing	Decreasing	Decreasing
1,1-DCE	Decreasing	Decreasing	Decreasing
Vinyl Chloride	No Trend	Decreasing	Decreasing
Total Chloroethanes	No Trend/Decreasing	Decreasing	Decreasing
1,1,1-TCA	Decreasing	Decreasing	Decreasing
1,1,2-TCA	Decreasing	Decreasing	Decreasing
1,1-DCA	Decreasing	Decreasing	Decreasing
1,2-DCA	Increasing	Increasing	Increasing
Toluene	Decreasing	Decreasing	Decreasing
Ethylbenzene	Decreasing	Decreasing	Decreasing
Xylenes	No Trend	Decreasing	Decreasing

The results summarized above indicate that the chloroethene, chloroethane, and aromatic hydrocarbon (toluene, ethylbenzene, and xylenes) plumes are all decreasing since April 2008. Additional characteristics of each of these plumes are discussed further below:

Chloroethenes

The results indicate that each of the individual chloroethene plumes are decreasing since April 2008 and on a total molar basis the chloroethene plume is also decreasing as observed in the figure below. It is noted that the total chloroethene plume (indicated by the solid yellow graph) is

in units of moles on the primary y axis, whereas the individual constituent ratios are shown in percent on the secondary y axis.

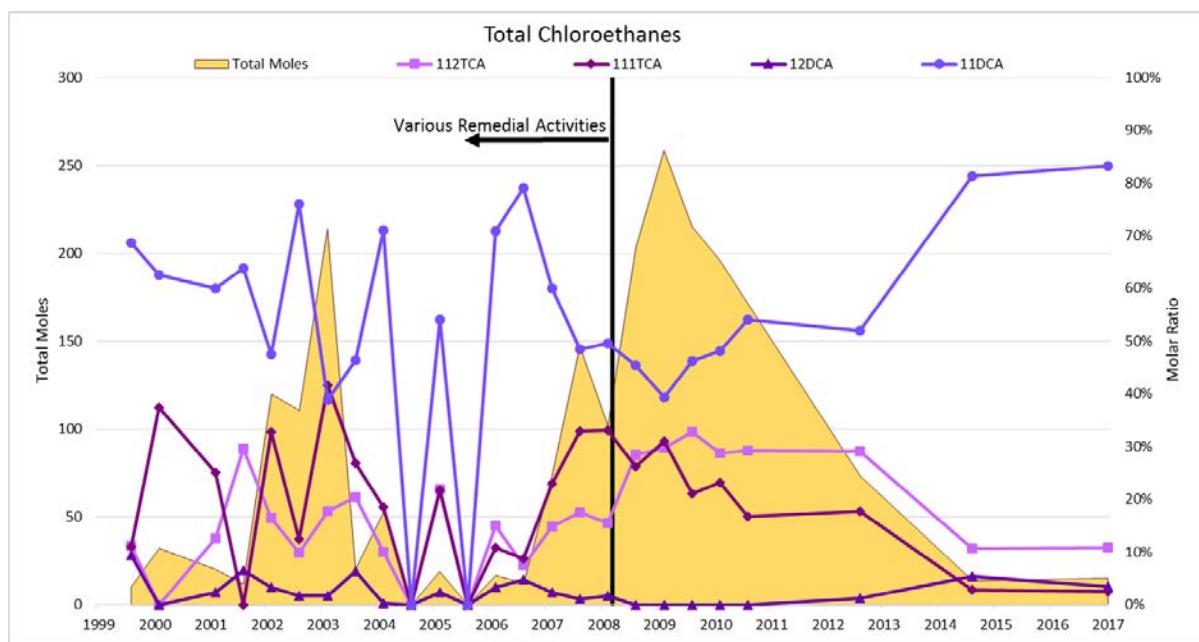

The above figure demonstrates that in addition to the strong decreasing trend since April 2008, the predominate constituent of the chloroethene plume is cis-1,2-DCE. As observed, cis-1,2-DCE represents roughly 80% to 90% of the total chloroethene plume on a molar ratio basis. It is known that during biological reductive dechlorination, the vast majority of dichloroethene (DCE) produced by the breakdown of PCE to TCE and eventually to DCE will occur as cis-1,2-DCE. The presence of a high percentage of ethenes as cis-1,2-DCE is a strong indicator that reductive dechlorination has occurred at the Site. However, the molar ratios of individual chloroethenes are remaining relatively constant since 1999. The combination of decreasing total moles with constant molar ratios is likely the result of chemical reductions across the plume from various in-situ remediation events.

The Spatial Change Indicator™ analysis shows that there is no apparent sourcing of chloroethenes occurring in the monitored area. Additionally, although the footprint of the plume shows stability and a reduction in size of 4% in area since April 2008, the average concentration and mass indicator of the chloroethene plume has shown a decrease of 88% for both metrics over that same time period.

Chloroethanes

Except for 1,2-DCA, each chloroethane plume is decreasing. It is known that 1,2-DCA is a daughter product derived from the dechlorination of 1,1,2-TCA and as observed in the following figure, 1,2-DCA is not a significant component of the total chloroethane plume:

As observed in the above figure, the chloroethanes exhibit similar behavior to the chloroethenes with a decreasing trend in mass indicator (total moles) since the cessation of remedial activities. Additionally, since the cessation of remedial activities the ratios of 1,1,2-TCA and 1,1,1-TCA (parents) are showing a decreasing trend in molar ratio while the daughter product 1,1-DCA is increasing in molar ratio. The combination of decreasing total moles with decreasing parent ratios and increasing daughter ratios is a good indication of biological reductive dechlorination.

The Spatial Change Indicator™ analysis shows that there is no apparent sourcing of chloroethanes occurring in the monitored area. Additionally, although the footprint of the total chloroethane plume shows stability and a reduction in size of 6% in area since April 2008, the average concentration and mass indicator of the chloroethane plume is decreasing 92% and 93%, respectively over that time period.

Aromatic Hydrocarbons

Toluene, ethylbenzene and xylenes are all exhibiting decreasing trends from September 2008 to February 2017. Additionally, no wells exceeded US EPA MCLs for toluene, ethylbenzene or xylenes during the February 2017 event.

MNA Parameters

Isopleth maps were produced for each of the MNA parameters sampled. The MNA isopleths show strong correlation and evidence that natural attenuation via degradation is occurring. For example, there is evidence of biodegradation through the observation of reduced electron acceptors (dissolved oxygen, nitrate, and sulfate); accumulation of metabolic byproducts (chloride, sulfide, methane, ethane, and ethene), and reducing conditions (e.g., negative

oxidation-reduction potential) at key locations within the plume. MNA isopleths are included in Figures 20 – 30 of Appendix E.

Data Gaps

As mentioned previously, to conduct this plume analysis a window had to be developed around the known site plumes. We noticed that during this exercise that there is an apparent data gap north of MW-3 where the plume is not delineated to non-detect or relatively low concentrations. We recommend the installation of a monitoring well to the north of MW-3 to close this data gap.

Additionally, based on the strong decreasing trends being observed at the site, we recommend continuing with a sampling program and continuing to update the plume stability analysis as data becomes available. Additional sampling events will help us assess whether the plumes will continue to decrease or whether additional remedial activities may be warranted. Based on current observations it appears that monitored natural attenuation may be a viable remedial approach but further analysis will help confirm that opinion. We recommend semi-annual groundwater sampling for a period of at least two years and updates to the Plume Analytics™ evaluation annually to evaluate the current behavior of the plume and feasibility of monitored natural attenuation to serve as an adequate remedy going forward.

3.0 INTERIM GROUNDWATER MONITORING PLAN

Based on the Plume Analytics™ study presented in Section 2.0, the evidence suggests that the plumes at the site are decreasing since the last remedial event. Additionally, the Plume Analytics™ study indicates that parent-daughter molar ratios suggest natural attenuation is occurring at the Site. To confirm these trends are sustained and to assist in developing Site remedial recommendations, additional groundwater data acquisition is required.

Lennox proposes to conduct semi-annual groundwater sampling for a period of two years (four sampling events). The groundwater sampling activities will be conducted in general accordance with the United States Environmental Protection Agency (USEPA) Region 4 Science and Ecosystem Support Division (SESD) Operating Procedures (OPs) for Groundwater (SESDPROC-301-R3, March 2013). The field activities to be conducted during each semi-annual groundwater monitoring event are described below:

- **Groundwater Level Measurements** – Prior to sampling, depth to groundwater measurements will be collected at all accessible wells. The groundwater level elevations will be used to prepare a potentiometric surface map for the Site.
- **Groundwater Sampling/Analysis** – Prior to sampling, each well will be purged using low-flow techniques. The field parameters of temperature, specific conductance, DO, ORP, ferrous iron and turbidity will be measured. When the pH and specific conductance of the

water have stabilized and the turbidity has either stabilized or is below 10 NTU the groundwater sample will be collected using low flow techniques.

A peristaltic pump and polyethylene tubing will be used to collect the groundwater samples. The groundwater samples will be collected from the intake end of the dedicated polyethylene discharge tubing after the peristaltic pump is stopped and the tubing is removed from the borehole. The groundwater samples will be placed into clean, laboratory-provided containers, labeled, recorded on a Chain-of-Custody form, and submitted to Shealy Environmental Services, Inc. (DHEC Certification No. 32010) located in Columbia, SC. The groundwater samples will be analyzed for VOCs using EPA Method 8260 and 1,4-dioxane using EPA Method 8260 SIM.

The samples will also be analyzed for the MNA parameters nitrate, sulfate, sulfide, chloride, alkalinity, TOC and dissolved gases (methane, ethane, ethane) to assist in the interpretation of the Plume Analytics™ outputs.

- **IDW Management** – Investigation derived waste (IDW) in the form of development/purge water will be generated during the groundwater sampling event. IDW will be managed in general accordance with the US EPA Region 4 SESD OP for Management of Investigation Derived Waste (SESDPROC-202-R3, July 3, 2014). Initially, IDW will be containerized, labeled, and stored onsite. Upon receipt of sampling results, the IDW will be properly disposed in accordance with the US EPA guidance.

As required in the Contract, Lennox via EarthCon will inform DHEC in writing at least five (5) days in advance of all scheduled field activities. We assume that email correspondence to the DHEC project manager will fulfill the “in writing” requirement.

Upon receipt of the laboratory data, EarthCon will conduct a cursory data validation and compile the data into an electronic database format (Excel). The data will then be incorporated into the Plume Analytics evaluation. A copy of the laboratory analytical report will be provided to SCDHEC after each semi-annual sampling event as part of the Section 6 required 6-month progress report. Within 90 days after completion of the fourth semi-annual sampling event, an updated Plume Analytics™ study will be presented in person to SCDHEC.

4.0 RECOMMENDATIONS

Based on the results of the well condition survey, summarized in Appendix A, minor well repairs are needed. They include replacement of flush mount well covers and repair of hinges on stick-up covers.

Results of the Plume Analytics™ study indicate a data gap and subsequent need for additional shallow groundwater data in the area north of well MW-3. To address this data gap, Lennox recommends installing one additional shallow monitoring well (MW-16) north of MW-3 in the location shown on Figure 4.

The well installation and repair activities described above can be conducted concurrent with the first semi-annual sampling event. This will allow sampling of the newly installed monitoring well during all four of the proposed semi-annual events.

Lastly, due to the visual nature of Plume Analytics™, Lennox strongly recommends that a meeting be held to present the results of the Plume Analytics™ study to SCDHEC. This meeting should be held as soon as practical but prior to final SCDHEC review of this document.

APPENDICES

APPENDIX A

SUMMARY OF FIELD PROCEDURES

APPENDIX A: SUMMARY OF FIELD PROCEDURES

Sampling events were conducted in January and February 2017 at the Former Ducane Company Site. The field activities are described in the following sections. Field sampling forms are provided in Appendix B. Laboratory analytical reports are provided in Appendix C.

GROUNDWATER SAMPLING

The groundwater sampling event was conducted from January 30 through February 2, 2017. During this event, 15 of the 19 monitoring wells were sampled. Monitoring wells MW-8, MW-12 and MW-13 could not be located while monitoring well MW-9 is located on private property and access could not be obtained.

Groundwater sampling was conducted in general accordance with the United States Environmental Protection Agency (USEPA) Region 4 Science and Ecosystem Support Division (SESD) Operating Procedure (OP) for *Groundwater Sampling* (SESDPROC-301-R3, March 2013) using low-flow techniques. Prior to sampling, water level measurements were collected from each well and water quality parameters were measured. Water level measurements are presented in Table 2 of the report. The field parameters measured at the time of groundwater sampling are provided on the field forms in Appendix B and presented in Table 3 of the report.

Well Inspection Survey

Well inspections were performed on January 30, 2017 for each well that could be located. The inspection included evaluating the condition of each well pad, protective cover, and cap to determine if repairs were needed. The padlocks on each well were replaced with new, keyed alike locks. Total depths of the wells were also measured and compared to historical information provided in the *Ground Water and Soil Assessment Report*, dated January 2013. A summary of the well conditions/repairs needed is provided below.

Well Number	Protective Cover	Well Condition	Repairs Needed
MW-1	Stick-up	Well cap present; well pad in good condition; protective cover locked and in good condition	None
MW-1D	Stick-up	Well cap present; well pad in good condition	Protective cover hinge broken; repairs needed
MW-2	Flush mount	Well cap present; well pad in good condition	Flush mount cover needs to be replaced
MW-2D	Flush mount	Well cap present; well pad in good condition	Flush mount cover needs to be replaced
MW-3	Stick-up	Well cap present; well pad in good condition	Protective cover hinge broken; repairs needed

Well Number	Protective Cover	Well Condition	Repairs Needed
MW-3D	Stick-up	Well cap present; well pad in good condition; protective cover locked and in good condition	None
MW-4	Stick-up	Well cap present; well pad in good condition	Protective cover hinge broken; repairs needed
MW-4D	Stick-up	Well cap present; well pad in good condition; protective cover locked and in good condition	None
MW-5	Flush mount	Well pad in good condition	Needs new well cap; flush mount cover needs bolts
MW-6R	Flush mount	Well cap present; well pad in good condition	Flush mount cover needs bolts
MW-7	None	Well pad in good condition; well cap missing, no protective cover	Needs flush mount cover and 1" well cap (temporary PVC cap affixed)
MW-10	Stick-up	Well cap present; well pad in good condition	Protective cover hinge broken; repairs needed
MW-11	Stick-up	Well cap present; well pad in good condition	Protective cover hinge broken; repairs needed
MW-14	Stick-up	Well cap present; well pad in good condition; protective cover locked and in good condition	None
MW-15	Stick-up	Well cap present; well pad in good condition; protective cover locked and in good condition	None

Note: wells MW-8, MW-12 and MW-13 could not be located or inspected; access to well MW-9 was not granted

Sample Containers

The laboratory provided sample containers that met the sampling requirements of the study. The laboratory verified the cleanliness of each batch of containers prior to use. The laboratory supplied the necessary preservation solutions and shipped these with the sample containers.

The field samplers took responsibility for properly identifying the location of each sample taken and for recording the sample date, the type of sample, the preservative used, and the applicable project number. This information was documented in the field book/field form. This same information was then placed on the sample identification label and the chain-of-custody record. Sample labels were filled out with indelible ink. If the field sampler determined that additional information was pertinent to a sample being taken, such data was recorded in the field book/field form.

Groundwater Level Measurement

Prior to well sampling, depth to groundwater and total well depth were measured using an electronic tape or water level indicator. A fixed point was marked with an indelible marker on each well to serve as a reference point for measurement. Depths were measured to the nearest 0.01 foot and recorded on the field sheet. The tape was cleaned with phosphate-free laboratory detergent and water, and rinsed with distilled water prior to each use.

Well Purging

The monitoring wells were purged using a low flow/low volume method with a peristaltic pump and dedicated, disposable, polyethylene tubing. The groundwater parameters of temperature, pH, specific conductivity, dissolved oxygen (DO), oxidation-reduction potential (ORP), and turbidity were measured during purging.

Purging continued until a minimum of three consecutive stable readings were measured with five to fifteen-minute intervals between readings. Pumping rates were reduced as much as possible to reduce the amount of drawdown in the wells.

Purging was considered complete after the depth to water and water quality parameters stabilized. Purge water from the wells was temporarily placed in five-gallon buckets and emptied into a 55-gallon steel drum. Additional information regarding the purging and sampling activities including the volume of water in each well, purge rate, and depth to water during the purge process are provided in the field sampling forms in Appendix B.

Groundwater Sampling and Analysis

Groundwater samples were collected after the water level in the well stabilized and after the pH and specific conductance measurements stabilized. A peristaltic pump and polyethylene tubing were used to collect the groundwater samples. The groundwater samples were collected from the intake end of the dedicated polyethylene discharge tubing after the peristaltic pump was stopped and the tubing was removed from the well. The groundwater samples were placed into laboratory supplied pre-preserved containers, labeled, and recorded on a Chain-of-Custody form. The containers were then placed in a cooler on ice, and transported to Shealy Environmental Services, Inc. (DHEC Certification No. 32010) in Columbia, SC.

The groundwater samples were analyzed for volatile organic compounds (VOCs) by EPA Method 8260 and 1,4-dioxane using EPA Method 8260 SIM. Groundwater samples were also analyzed for the monitored natural attenuation (MNA) parameters nitrate, sulfate, sulfide, chloride, alkalinity, total organic carbon (TOC) and dissolved gasses (methane, ethane, and ethene). Field measurements of ferrous iron were also collected. Groundwater samples from monitoring wells MW-1, MW-3 and MW-6R were also analyzed for TAL metals.

Decontamination Procedures

Decontamination procedures consisted of the use of dedicated, disposable tubing at each sampling location. Equipment such as the water level indicator and field measurement instrumentation were cleaned with phosphate-free laboratory detergent and rinsed with distilled water in general accordance with the EPA SESD OP for *Field Equipment Cleaning and Decontamination* (SESDPROC-205-R2, December 2011). The equipment was allowed to air dry. Nitrile gloves were also worn and changed between each sampling location.

Equipment Calibration

Equipment used to perform field testing on groundwater samples included a YSI 556 with flow thru cell and a Scientific Micro TPW, HF Scientific, or Lamotte turbidity meter to measure pH, specific conductivity, temperature, dissolved oxygen, ORP, and turbidity. Equipment calibration was verified on a daily basis.

Field Sampling Forms

Field personnel maintained a permanently bound, water resistant field notebook. Field activities were recorded with indelible ink. Additionally, sampling field forms were completed for each sample. The notebook, sampling forms, and chain-of-custody records contain sufficient information to allow reconstruction of the sample collection and handling procedures at a later time.

Chain-of-Custody

Sample custody was documented from the time of sample collection when the labeled sample was placed into an iced cooler in the possession of the sampling technician. A corresponding line item on the chain-of-custody record was filled out and initialed by the sampling technicians. The chain-of-custody record is used to track custody of samples during transport and shipping. Upon completion of appropriate line items, or upon sample pick-up, the field representative signed, dated, listed the time, and confirmed the completeness of descriptive information contained on the form. The chain-of-custody form accompanied the samples and terminated upon laboratory receipt of samples. All entries were recorded in ink. Each sample had a corresponding entry on a chain-of-custody record.

Analytical Procedures and QA/QC

Groundwater samples were transported to Shealy Environmental Services, Inc. under chain-of-custody protocols. The samples were analyzed for VOCs by EPA Method 8260 and 1,4-dioxane by EPA Method 8260 SIM. Quality control samples, consisting of a blind duplicate, trip blanks, and laboratory method blanks were also collected and analyzed for these parameters.

LABORATORY ANALYTICAL REPORTS

SHEALY ENVIRONMENTAL SERVICES, INC.

Report of Analysis

EarthCon Consultants, Inc.

1880 West Oak Parkway
Building 100, Suite 106
Marietta, GA 30062
Attention: Carol Northern

Project Name: **Lennox, Blackville, SC**

Project Number: **02.20160378.00**

Lot Number: **SB01014**

Date Completed: **02/09/2017**

Lucas Odom

Project Manager

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

SHEALY ENVIRONMENTAL SERVICES, INC.

SC DHEC No: 32010

NELAC No: E87653

NC DENR No: 329

NC Field Parameters No: 5639

Case Narrative EarthCon Consultants, Inc. Lot Number: SB01014

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

VOCs by GC/MS

The LCS associated with batch 33405 recovered multiple compounds above method criteria. No corrective action is required as all associated samples are non-detect for these compounds.

Dissolved Gases

The Method Blank associated with batch 33294 yielded a "J" value detection for Methane. No corrective action is required as this is an estimated value recovered below the PQL. All associated samples have been qualified with a "B".

PQL = Practical quantitation limit

P = The RPD between two GC columns exceeds 40%

N = Recovery is out of criteria

ND = Not detected at or above the MDL

J = Estimated result < PQL and \geq MDL

+ = RPD is out of criteria

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

PQL = Practical quantitation limit

P = The RPD between two GC columns exceeds 40%

N = Recovery is out of criteria

ND = Not detected at or above the MDL

J = Estimated result < PQL and \geq MDL

+ = RPD is out of criteria

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

NC Field Parameters No: 5639

Case Narrative EarthCon Consultants, Inc. Lot Number: SB02014

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Dissolved Gases

The LCS associated with batch 33741 recovered Propane marginally above method criteria. No corrective action is required as all associated samples are non-detect for this compound.

Case Narrative EarthCon Consultants, Inc. Lot Number: SB03001

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

PQL = Practical quantitation limit

P = The RPD between two GC columns exceeds 40%

N = Recovery is out of criteria

ND = Not detected at or above the MDL

J = Estimated result < PQL and ≥ MDL

+ = RPD is out of criteria

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Volatile Organic Compounds by GC/MS - LCS

Sample ID: SQ33672-002

Batch: 33672

Analytical Method: 8260B

Matrix: Aqueous

Prep Method: 5030B

Parameter	Spike Amount (ug/L)	Result (ug/L)	Q	Dil	% Rec	% Rec Limit	Analysis Date
Trichloroethene	50	48		1	96	70-130	02/06/2017 0922

Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 4. Is the commercial courier's packing slip attached to this form?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 5. Were proper custody procedures (relinquished/received) followed?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 6. Were sample IDs listed on the COC?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 7. Were sample IDs listed on all sample containers?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 8. Was collection date & time listed on the COC?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 9. Was collection date & time listed on all sample containers?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 10. Did all container label information (ID, date, time) agree with the COC?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 11. Were tests to be performed listed on the COC?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 13. Was adequate sample volume available?
Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 16. Were bubbles present >"pea-size" (½" or 6mm in diameter) in any VOA vials?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 17. Were all DRO/metals/nutrient samples received at a pH of <2?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 19. Were all applicable NH3/TKN/cyanide/phenol/BNA (<0.5mg/L) samples free of residual chlorine?
Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 20. Were collection temperatures documented on the COC for NC samples?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 21. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc...) correctly transcribed from the COC into the comment section in LIMS?
Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/> 22. Was the quote number used taken from the container label? <u>18651</u>
Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)		
Sample(s) _____ were received incorrectly preserved and were adjusted accordingly in sample receiving with <u>(H₂SO₄, HNO₃, HCl, NaOH)</u> using SR # _____.		
Sample(s) _____ were received with bubbles >6 mm in diameter.		
Samples(s) _____ were received with TRC >0.5 mg/L (If #21 is No) and were adjusted accordingly in sample receiving with sodium thiosulfate (Na ₂ S ₂ O ₃) with Shealy ID: _____.		
SC Drinking Water Project Sample(s) pH verified to be < 2 by _____ Date: _____.		
Sample(s) _____ were Not received at a pH of < 2 and were adjusted accordingly using SR# _____.		
Sample labels applied by: <u>600</u> Verified by: <u>600</u> Date: <u>12/3/17</u>

APPENDIX D: GROUNDWATER HISTORICAL DATA SUMMARY

Water Supply Wells

APPENDIX D: GROUNDWATER HISTORICAL DATA SUMMARY

Notes:

Concentrations reported in micrograms per liter

< - concentration less than the stated reporting limit (RL) or practical quantitation limit (PQL); detection limit for 1,4-dioxane is the method detection limit (MDL)

ND - not detected above the RL or PQL (limits not provided)

ND - not detected

.I - estimated concentration

J - estimated concentration
-- constituent not analyzed

APPENDIX E

RICKER METHOD® PLUME STABILITY ANALYSIS

Notes:

All concentrations in $\mu\text{g/l}$

NA: Well not installed, abandoned or otherwise not utilized.

<5.00: Analyte not detected. (Detection limit value used).

<100 (10): Analyte not detected. (Assigned value shown).

NS (5): Well not sampled. (Assigned value shown).

Non-Sampled well assumed non-detect

Interpolated between two sampling events.

Extrapolated from a sampling event.

Well not installed. Extrapolated from a sampling event.

Notes:

All concentrations in µg/l

NA: Well not installed, abandoned or otherwise not utilized.

<5.00: Analyte not detected. (Detection limit value used).

<100 (10): Analyte not detected. (Assigned value shown).

NS (5): Well not sampled. (Assigned value shown).

 Non-Sampled well assumed non-detect

 Interpolated between two sampling events.

 Extrapolated from a sampling event.

 Well not installed. Extrapolated from a sampling event.

Notes:

All concentrations in $\mu\text{g/l}$

NA: Well not installed, abandoned or otherwise not utilized.

<5.00: Analyte not detected. (Detection limit value used).

<100 (10): Analyte not detected. (Assigned value shown).

NS (5): Well not sampled. (Assigned value shown).

Non-Sampled well assumed non-detect

Interpolated between two sampling events.

Extrapolated from a sampling event.

Well not installed. Extrapolated from a sampling event.

Notes:

All concentrations in $\mu\text{g/l}$

NA: Well not installed, abandoned or otherwise not utilized.

<5.00: Analyte not detected. (Detection limit value used).

<100 (10): Analyte not detected. (Assigned value shown).

NS (5): Well not sampled. (Assigned value shown).

Non-Sampled well assumed non-detect

Interpolated between two sampling events.

Extrapolated from a sampling event.

Well not installed. Extrapolated from a sampling event.

Plume Stability Analysis Summary
Xylenes

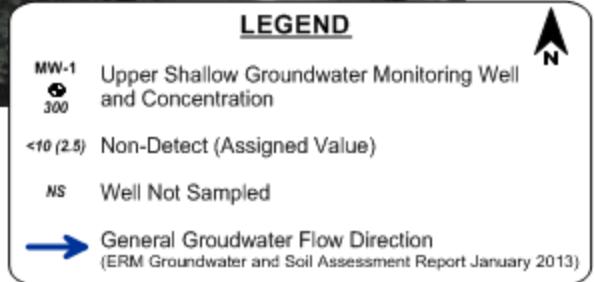

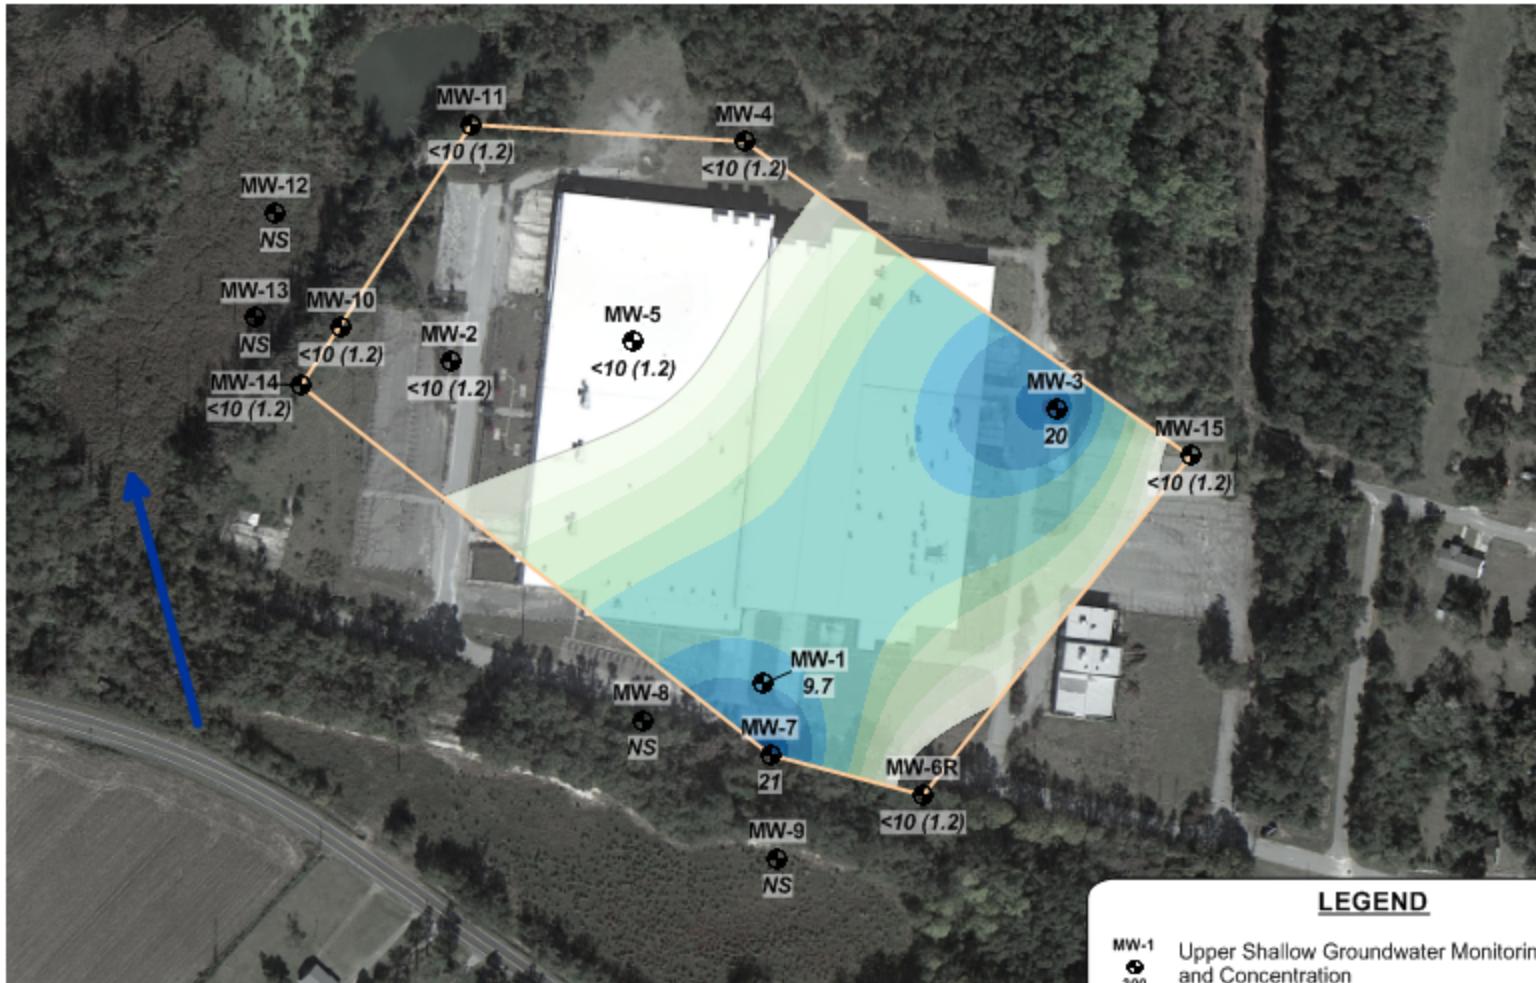

LEGEND

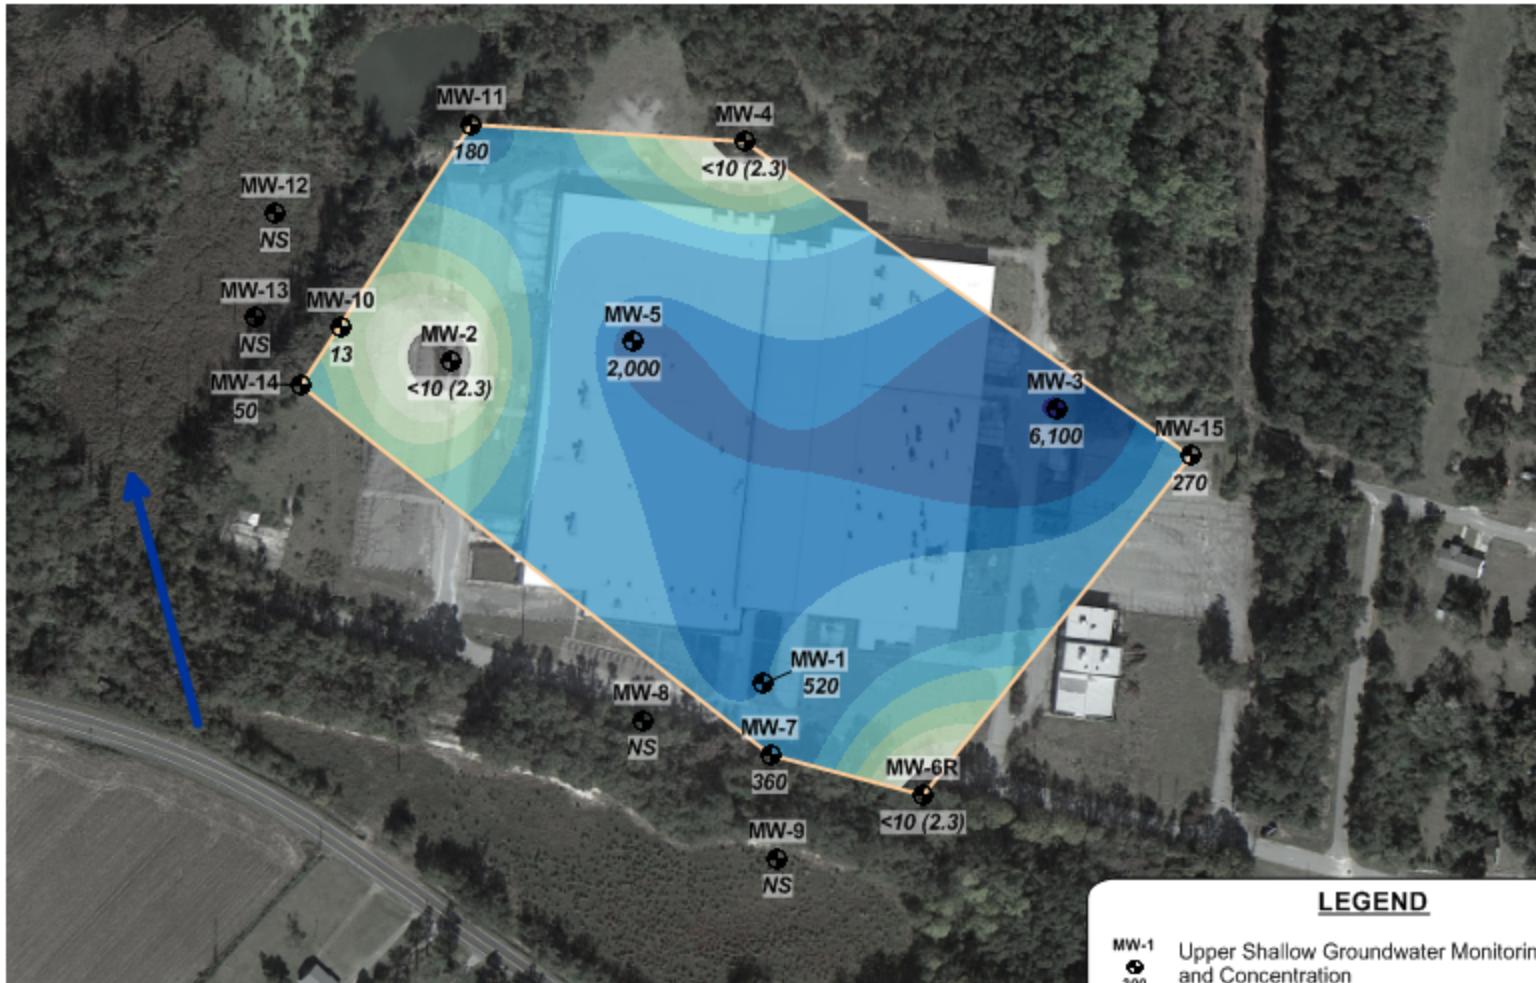

- MW-1** Upper Shallow Groundwater Monitoring Well and Concentration
300
- <10 (2.5) Non-Detect (Assigned Value)
- NS Well Not Sampled
- General Groundwater Flow Direction
(ERM Groundwater and Soil Assessment Report January 2013)

Note:

This analysis requires fixed data points within a fixed area for the purposes of assessing relative changes of area, average concentration, and mass indicator over time. Therefore, any created isopleth maps are not intended to be a depiction or model of the actual plume but rather is meant to show conceptual behavior of the aforementioned metrics over time.

Note:
This analysis requires fixed data points within a fixed area for the purposes of assessing relative changes of area, average concentration, and mass indicator over time.
