Woven Electronics, LLC
Voluntary Cleanup Contract #13-6203-RP
BLWM File #418096
Simpsonville, South Carolina

Dear Genevieve L. Keller-Milliken:

Haley & Aldrich, Inc. respectfully submits the attached *Supplemental Remedial Investigation Report* on behalf of Woven Electronics, LLC (Woven) for the Woven manufacturing facility located at 1001 Old Stage Road, in Simpsonville, South Carolina. This report includes monitoring data from the August 2025 groundwater and surface water sampling event, performance monitoring results from the sub-slab depressurization/soil vapor extraction system, as well as the recent monitoring well installation details.

Please do not hesitate to call Bruce Wilkinson at 857.498.1277 if you have any questions or need additional information.

Sincerely yours,
HALEY & ALDRICH, INC.

1. Introduction

This *Supplemental Remedial Investigation Report* (Report) was prepared by Haley & Aldrich, Inc. (Haley & Aldrich) for the Woven Electronics, LLC (Woven) manufacturing facility located at 1001 Old Stage Road in Simpsonville, Greenville County, South Carolina (Site). This Report documents and summarizes the following:

- Installation of supplemental wells with corresponding soil and groundwater sampling performed and completed in July and August 2025.
- The monitoring results from the sub-slab soil gas event.
- The performance monitoring results from the sub-slab depressurization/soil vapor extraction (SSDS/SVE) system.
- The monitoring data from the groundwater and surface water semiannual sampling event.

This Report is organized into seven sections with figures, tables, and the appendices included after the text. Section 1 provides the introduction, summary of previous investigations, and the Conceptual Site Model (CSM). Section 2 presents the summary of the supplemental remedial investigation of the well installation and the sub-slab soil gas sampling activities and results. Section 3 presents the summary of the August 2025 groundwater monitoring activities and results. Section 4 presents the summary of the August 2025 surface water sampling activities and results. Section 5 provides data validation and analysis. Section 6 presents a summary of quality assurance and quality control (QA/QC). Section 7 summarizes the conclusions and recommendations. A references section is provided at the end of this Report.

1.1 SITE DESCRIPTION/BACKGROUND

The Site is approximately 16.5 acres and is identified by the Greenville County Property Assessor as Parcel 0303000100300. A Site location map is provided on **Figure 1**. In 1963, the Site was developed from vacant land into an electronics manufacturing assembly and weaving facility. The facility interior includes offices, shipping areas, storage, assembly, and weaving process areas. The surrounding land is primarily characterized by industrial and manufacturing facilities, as well as vacant and undeveloped land.

As depicted on the topographic map on **Figure 1**, the Site slopes predominantly to the southwest. The ground surface slopes to the northwest along the northern property boundary. The watershed drainage is generally to the southwest toward the headwater tributaries of Rocky Creek. The elevation of the Site is approximately 900 feet above sea level, sloping southwest to an elevation of 820 feet along the unnamed creek.

An unnamed creek is located on the southern adjacent property owned by Sealed Air Corporation (Sealed Air). The unnamed creek flows to the west toward Rocky Creek and ultimately discharges to the Reedy River. Adjacent property to the west is vacant, wooded, and undeveloped, and to the north and east, the properties are utilized for manufacturing and industrial operations.

1.2 PRIOR FACILITY INVESTIGATIONS AND REMEDIAL ACTIONS

Soil, soil gas, groundwater investigations, and *in situ* remedial actions conducted between 2010 and the present confirm that there have been volatile organic compound (VOC) impacts to Site soil and

groundwater. A Site index map of investigation locations is included on **Figure 2**. Previous investigation and remedial activities at the Site are detailed in the following reports:

- September 2010 – *Phase I ESA* by CRB Geological & Environmental Services, Inc. (CRB)
- March 2011 – *Soil Gas Survey* by CRB
- November 2012 – *Groundwater Assessment* by CRB
- June 2014 – *CSM* by CRB
- January 2015 – *Remedial Investigation* by CRB
- March 2017 – *Remedial Investigation Repor*t by CRB
- April 2018 – *Pilot-Scale Remediation Work Plan* by CRB
- December 2019 – *Pilot-Scale Remediation Interim Report* by CRB
- March 2020 – *Pilot-Scale Remediation Interim Report* by CRB
- June 2020 – *Pilot-Scale Remediation Interim Report* by CRB
- March 2021 – *Feasibility Study Report* by CRB
- June 2023 – *Remedial Investigation and Pilot-Test Scale Remediation Study Work Plan* by Haley & Aldrich
- October 2023 – *2023 Baseline Groundwater Monitoring Report* by Haley & Aldrich
- April 2024 – *2024 Supplemental Remedial Investigation Work Plan* by Haley & Aldrich
- June 2024 – *March 2024 Site-Wide Groundwater Monitoring Summary, Remedial Investigation, and Pilot-Scale Remediation Study Report* by Haley & Aldrich
- November 2024 – *Fall 2024 Site-Wide Groundwater Monitoring and Supplemental Investigation Summary Report* by Haley & Aldrich
- March 2025 – *Summary of Sub-Slab Soil Gas Assessment* by Haley & Aldrich
- May 2025 – *March 2025 Site-Wide Groundwater and Surface Water Monitoring Summary Report* by Haley & Aldrich
- June 2025 – *2025 Supplemental Remedial Investigation Work Plan* by Haley & Aldrich

1.3 CONCEPTUAL SITE MODEL

The update to the CSM was provided in previous reports, including information on pertinent geologic features, the occurrence and migration of groundwater, and the surface water drainage features at the Site. Geology and hydrogeology were determined from maps and publications produced by the South Carolina Geological Survey and United States Department of Agriculture Soil Survey, as well as observations during investigation activities. A summary of the CSM is included in this section for reference.

1.3.1 Soil Description

Surficial soils at the Site are clay-rich silty residuum of weathered gneiss or schist bedrock with low to moderate permeability. The slope of surface soils follows erosion channels to nearby creeks or drainage basins. The soil is normally red to brown iron rich sandy to clayey silt below a thin organic surface.

1.3.2 Geology and Physiography

The Site is located in the Piedmont Physiographic region, which is characterized by variable weathering patterns and variable location of bedrock depth. According to prior reports, bedrock has been encountered within 30 feet below ground surface (bgs) in the downgradient area of the Site and deeper than 60 feet bgs in the area below the Main Building. Drilling oversight performed during the injection well installation by Haley & Aldrich in 2023 indicated that neither partially weathered rock nor bedrock were encountered at the maximum drilling depth of 55 feet bgs beneath the facility building. Three supplemental monitoring wells were installed in August 2025 and are located in the upgradient area of the Site, to the northeast loading dock and along the northern exterior portion of the building. The drilling performed did not encounter bedrock at the maximum depth of the borings at 35 feet bgs. The topography slopes to the southwest toward the local watershed drainage.

1.3.3 Hydrogeology

The Site subsurface hydrogeology is categorized into three hydrostratigraphic units. The three hydrostratigraphic units are hydraulically connected with groundwater flow to the southwest. The Site encapsulates a recharge plain in the high ground of the eastern part of the Site to a groundwater baseflow discharge zone located along the unnamed creek to the southwest of the Site property.

Slug tests were performed on intermediate and bedrock monitoring wells in January 2024. Linear velocities using the August 2025 gauging information for the saprolite, transition zone, and deep (fractured bedrock) hydrostratigraphic units are approximately 215 feet per year, 32 feet per year, and 132 feet per year, respectively. The calculations for linear velocities are included in **Appendix A**.

1.3.4 Surface Water Bodies

The topography in the vicinity of the Site is generally flat, with rolling hills dissected by the unnamed creek and an off-Site stream to the southwest. The unnamed creek originates near the southern boundary of the Site and flows west. Historical surface water samples from the unnamed creek contained tetrachloroethene (PCE) at a maximum concentration of 28 micrograms per liter (µg/L), which was consistent with the nearby groundwater concentrations in 2015. According to prior reports, access was terminated to the unnamed creek by Sealed Air after 2015. During a meeting on February 13, 2024, South Carolina Department of Environmental Services (SCDES) indicated that updated surface water quality will be required from the unnamed creek prior to generating an updated Feasibility Study (FS) Report for the Site. Annual surface water sampling for SW-2, SW-3, SW-5, and SW-8 is required until a remedy is selected as stated in SCDES's response letter, dated June 23, 2025, to the *March 2025 Site Groundwater and Surface Water Monitoring Report*. The Site Access Agreement and Permission to Enter Property, effective November 19, 2024, between Sealed Air and Woven allowed access to the northern portion of the Sealed Air property to complete the surface water sampling activities for up to two years. Surface water was sampled in March 2025 and August 2025; the methodology and results for the August event are further discussed in Section 4.

1.3.5 Constituent Releases and Transport

VOCs are present at the Site in the saprolite, transition, and bedrock aquifer zones. Based on the most recent groundwater sampling results in August 2025, concentrations of PCE extend from the area beneath the building slab, following groundwater flow downgradient to the Site boundary in the direction of the unnamed creek.

PCE is the primary constituent of concern (COC) in groundwater and has been detected above the SCDES Maximum Contaminant Level (MCL) during historical and recent sampling events. Degradation products, including trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), and vinyl chloride were not detected above their respective MCLs during recent sampling events, except for cis-1,2-DCE at MW-10S. The compound 1,1-dichloroethane was detected above the MCL at MW-14.

The primary suspected release area was associated with unspecified activities at the former back of the facility that has since been covered with a building addition; however, an area beneath the original facility located to the northeast of MW-17 has shown elevated concentrations of PCE, which suggests there may be another unidentified release area beneath the building. Well MW-17 is located upgradient of the previously reported primary suspected release area. Based on the supplemental investigation completed within the building footprint, including a passive soil gas survey and sub-slab soil gas sampling efforts, a previously unidentified source area is likely present to the northeast of MW-17 beneath the building. To further delineate the upgradient, northern boundary of the plume, supplemental monitoring wells (MW 24 and MW 25) were installed in August 2025 and are further discussed in this Report. The upgradient plume that is displayed by these wells indicated the northern boundary of PCE-impacted groundwater has been delineated to the north.

2. Summary of Supplemental Remedial Investigation

2.1 SUMMARY OF SUPPLEMENTAL FIELD ACTIVITIES

A passive soil gas survey, conducted in fall 2024, identified shallow soil gas impacts to the north and east of monitoring well MW-17 within the building. Results were documented in the *Fall 2024 Site-Wide Groundwater Monitoring and Supplemental Investigation Summary Report* (dated November 25, 2024). These findings indicated that further investigation was warranted in the impacted area.

To further assess the extent of potential PCE impacts, an active soil gas investigation was performed in January 2025. Twelve new Vapor Pins® were installed to collect sub-slab soil vapor samples. PCE concentrations exceeding United States Environmental Protection Agency (EPA) Vapor Intrusion Screening Levels (VISLs) were detected, consistent with the passive survey results. These findings support the presence of a separate PCE source to the north and east of MW-17 that is potentially contributing to the elevated concentrations observed in groundwater. This assessment was documented in the *Summary of Sub-Slab Soil Gas Assessment – January 2025 Technical Memorandum* (dated March 21, 2025).

Following a meeting with SCDES on May 16, 2025, the following actions were proposed:

- Installation of additional monitoring wells near the northeastern loading dock and along the northern portion of the building to investigate the northerly extent of PCE impacts.
- Collection of another round of sub-slab soil gas samples in August 2025 to evaluate seasonal variations.
- Installation of an additional monitoring well to further delineate PCE in groundwater to the south of MW-8 along the property boundary.

The following section describes the supplemental field activities, including the supplemental monitoring well installation and corresponding soil and groundwater sampling and sub-surface soil gas sampling as proposed in the *2025 Supplemental Remedial Investigation Work Plan* (Supplemental RI Work Plan), dated June 16, 2025.

2.1.1 Utility Locate

Prior to intrusive activities, Haley & Aldrich submitted a public utility location ticket via South Carolina 811 to locate and mark public utilities in the vicinity of the proposed supplemental monitoring well locations. Haley & Aldrich mobilized to the Site with a subcontracted private utility location firm on July 9, 2025 to conduct a private utility location proximal to proposed monitoring well locations using electromagnetic and ground-penetrating radar technologies. The proposed monitoring well location for MW-25 was shifted north approximately 80 feet due to the presence of utilities.

2.1.2 Supplemental Monitoring Well Installation

Supplemental monitoring wells MW-24, MW-25, and MW-26 were installed in accordance with the Supplemental RI Work Plan. However, MW-25 was moved to the north across the parking lot due to overhead and underground utility constraints. The approval of well installations for MW 24 and for contingency well MW-24A, MW 25, and MW 26 were issued on June 20, 2025 by SCDES. Following the installation of MW-24, a groundwater sample was collected using low-flow methods and shipped to

Eurofins Laboratories on a 24-hour turnaround time for VOC analysis by EPA Method 8260D. VOCs, including PCE and its daughter products, were detected below reporting limits; therefore, the additional well, MW-24A, was not installed, as this location was unnecessary for delineation of the northern upgradient plume boundary.

Supplemental monitoring wells MW-24, MW-25, and MW-26 were installed at the locations shown on **Figure 2** using hollow-stem auger drilling methods. Each well was constructed in accordance with SCDES Regulation 61-71 Well Standards. The wells were completed with 2-inch-diameter polyvinyl chloride (PVC) casings and 10-foot-long, 0.010-inch slotted PVC well screens. Based on gauged water levels observed during drilling, the screen intervals for all three wells were placed from 25 to 35 feet bgs.

During installation, the monitoring wells were constructed with an effective size #2 silica sand filter pack placed from the bottom of the borehole in the annular space to 2 feet above the screened interval. Following placement of the filter pack, the well was developed using a submersible pump. After development, a bentonite seal was installed and allowed to hydrate. Portland cement grout was then tremie-piped into the remaining annular space to ground surface. MW-24 and MW-25 were completed with flush-mounted protective manhole covers, while MW-26 was completed with a steel protective stick-up cover. All well locations were completed with 2-foot by 2-foot concrete pads.

Boring logs, well construction logs, and SCDES 1903 Well Record Forms for the installation of MW-24, MW-25, and MW-26 are included in **Appendices B** and **C**, respectively. Monitoring wells MW-24, MW-25, and MW-26 were sampled during the August 2025 sampling event. Water level gauging and discussion of results for the sampling event are included in Section 3.

In accordance with the Supplemental RI Work Plan, soil samples were also collected from MW-24 and MW-25 for EPA Method 8260 VOC analysis based on photoionization detector (PID) readings. The PID readings taken at MW-24 did not provide evidence impacts; therefore, a shallow soil sample was collected from 2.5 to 3.5 feet bgs. A second soil sample was collected from MW-25 from the interval between 11 and 13 feet bgs based on the highest PID reading.

A survey of the supplemental monitoring well locations was completed on September 5, 2025 by a licensed South Carolina surveyor and is included in **Appendix D**.

2.1.3 Vapor Pin® Sampling

Vapor Pins® VP-1 through VP-16 were sampled between July 31 and August 1, 2025 to evaluate seasonal variations in sub-slab soil gas. The Vapor Pins® locations are shown on **Figure 3**. Prior to sampling the Vapor Pins®, the locations and equipment were checked for leakage using a water dam test and then purged. The sample collection rate did not exceed 200 milliliters per minute using flow controllers set by the laboratory and no leaks were detected. A PID was utilized prior to sample collection for field screening. Differential pressure readings were collected using a micromanometer at VP-1 through VP-16. The PID and differential pressure readings are recorded on the sub-slab soil gas sampling field forms provided in **Appendix E** and are shown on **Figure 4**.

Sub-slab soil gas samples were collected via 1-liter SUMMA® canisters and submitted to Pace Analytical National Center for Testing and Innovation (Pace) in Mount Juliet Tennessee, a South Carolina-certified laboratory, for VOC analysis by EPA Method TO-15.

2.1.4 Soil Vapor Extraction System Sampling

Effluent samples of the SVE system were collected as part of the quarterly performance monitoring of the system on July 31, 2025. In addition, air samples were collected from the individual sub-slab SVE ports (SVE-EW-1 through SVE-EW-4) installed at individual well heads to evaluate the effectiveness of the SSDS SVE system. Air samples from both monitoring events were collected using 1-liter SUMMA® canisters and submitted to Pace for VOC analysis by EPA Method TO-15.

2.2 SUMMARY OF SUPPLEMENTAL INVESTIGATION RESULTS

2.2.1 Supplemental Monitoring Well Results

Soil results from the supplemental well installation completed in August 2025 are presented in **Table I**. Laboratory analytical reports and chain of custody documents are provided in **Appendix F**. Concentrations are reported in micrograms per kilogram.

As shown in **Table I**, four VOCs, including PCE, naphthalene, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene, were detected one or more soil samples, but were below the EPA Regional Screening Criteria for commercial use.

2.2.2 Vapor Pin® Sampling Results

Sub-slab soil gas results from the August 2025 sampling event are presented in **Table II**. The PCE concentrations and differential pressures for select Vapor Pins® are included on **Figure 4**. Laboratory analytical reports and chain of custody documents are provided in **Appendix F**. Concentrations of PCE are reported in micrograms per cubic meter (µg/m^3) and differential pressure in inches of water column (in. WC) readings for the sampled Vapor Pins®.

As shown in **Table II**, with the exception of PCE and TCE, detections of VOCs for Vapor Pins® VP-1 through VP-16 sampled in August 2025 were below the respective target sub-slab soil gas concentrations as calculated using the EPA's commercial VISL assuming a target hazard quotient of 1 and target risk of 10^{-6}. Four of the 16 Vapor Pins® (VP-11, VP-12, VP-15, and VP-16), located in the northwestern portion of the building, had detections of PCE above the VISL concentration of 1,570 µg/m^3. One Vapor Pin® (VP-6), located near the former back wall of the original building footprint, detected TCE above the VISL concentration of 100 µg/m^3. The TCE result for VP-6 is considered an outlier and is not representative of actual conditions, as previous results for TCE at VP-6 have been non-detect. This will be confirmed during future sampling events.

The differential pressures measured from the Vapor Pins® located near the SSDS/SVE system (VP-1 through VP-4) ranged from -0.015 to -0.126 in. WC. The negative values indicate the SSDS/SVE system is operating as desired.

A baseline event for all Vapor Pins® was completed in January 2025 while the SSDS/SVE system was not operating. The differential pressure readings for the 16 Vapor Pins® during the baseline event were not noticeably different and suggest that the building slab was under net-neutral pressure (there was not a significantly positive or negative influence of pressure). In August 2025, the SSDS/SVE system was operational and influence was observed at Vapor Pins® VP-1 through VP-7, located approximately 30 feet from the SSDS/SVE system, based on differential pressure readings of -0.128 in. WC and -0.019 in. WC, respectively. The remaining Vapor Pins® had similar readings to the baseline event; therefore, this

suggests the building slab remains under net-neutral pressure outside the area of influence of the SSDS/SVE system.

2.2.3 Soil Vapor Extraction System Sampling

Prior to sampling during the quarterly sampling events, field measurements were collected from the exhaust port, including vapor and vacuum measurements. The sample was obtained from the SVE exhaust port over a five-minute span and submitted to the laboratory for analysis. Results from the SVE sampling data indicate that contaminant concentrations have decreased since the sample data from 2018. The table below presents the PCE concentrations since September 2018.

Table 2-1: PCE Results for SVE Exhaust

Date	Results (µg/m^3)
September 2018	3,800
August 2023	1,300
September 2023	400
October 2023	840
November 2023	49.8
December 2023	19.3
March 2024	644
June 2024	548
July 2024	1,440
October 2024	679
December 2024	369
February 2025	1,510
April 2025	923
August 2025	439

Notes:
**Data generated prior to August 2023 were sampled by CRB.*
µg/m^3 = micrograms per cubic meter

Based on the PCE concentrations and measured air velocity of 1,280 feet per minute, the total PCE mass removed was calculated as 7.0 pounds (lbs.) between August 2023 and July 2025. Detected concentrations of PCE indicate continued removal of sub-slab impacts via the SVE system.

Collection of quarterly operations and maintenance (O&M) samples of the SSDS/SVE effluent are planned to continue and will be incorporated into future status reporting to the SCDES.

3. August 2025 Groundwater Sampling Activities and Results

The following section describes the groundwater sampling activities and the inferred groundwater flow directions for the August 2025 groundwater sampling event. Monitoring well locations are shown on **Figure 2**. Groundwater flow interpretations are provided on **Figures 5** through **7**. PCE isoconcentration maps are provided on **Figures 8** through **10**. A hydrostratigraphic cross-section transects layout is provided on **Figure 11** and cross-sections with PCE plume interpretations are provided on **Figures 12** through **14**.

3.1 WATER LEVEL MEASUREMENTS

The water level in each monitoring well was measured using an electronic water level indicator. To prevent cross-contamination, the water level indicator was decontaminated with an Alconox® solution wipe and a distilled water rinse between monitoring wells. Water level measurements were made from a fixed reference point marked on the top of inner casing (TIC) of the well or the northern side of the TIC if a mark was not present.

Monitoring well construction details are provided in **Table III**. **Table IV** includes a summary of the monitoring well TIC elevations, groundwater level measurements, and the static water level elevations collected from 32 monitoring wells on August 11 and 12, 2025. Monitoring wells MW-20S and MW-21S were dry and were not gauged. The groundwater elevation is calculated by recording the distance from the water surface (water level measurements) to the referenced measuring point (TIC). These data were used to calculate groundwater elevations and horizontal hydraulic gradients and to construct the groundwater potentiometric surface maps for each aquifer zone, as shown on **Figures 5** through **7**.

3.2 GROUNDWATER FLOW DIRECTION

The groundwater flow direction in the saprolite and transition zone aquifers is generally to the southwest toward the unnamed creek, as shown on **Figures 5** and **6**, respectively. In the bedrock aquifer, the general groundwater flow direction is also interpreted to be to the southwest, as shown on **Figure 7**. Interpreted groundwater flow directions are consistent with prior assessment results.

3.3 GRADIENT CALCULATIONS

Groundwater level measurements collected were used to calculate vertical flow potentials at well pairs of the three groundwater aquifer zones at the Site. Vertical flow potentials were identified for the saprolite to transition, and the transition to the deep (bedrock) wells as shown in **Table 3-1** on the following page.

The average horizontal groundwater gradient calculated using August 2025 gauging information from the saprolite zone was 0.030 feet per foot, transition zone was 0.022 feet per foot, and deep zone was 0.045 feet per foot. An effective porosity of 25 percent was used for the saprolite and transition aquifers. An effective porosity of 10 percent was also assumed for the bedrock aquifer zone. The average hydraulic conductivity value of 5 feet per day for the shallow zone was documented in the June 2014 CSM (CRB, 2014). Based on slug test data collected by Haley & Aldrich in January 2024, the transition zone hydraulic conductivity value was 1.00 feet per day and the deep zone was 0.80 feet per day. Using these respective hydraulic conductivity values, the calculated groundwater flow velocities within the saprolite aquifer are estimated to be 215 feet per year, transition zone to be 32 feet per year, and deep zone to be 132 feet

per year. Based on these estimated flow velocities, and compared to the interpreted PCE plume configurations, the saprolite, transition, and bedrock zones appear to reflect expected conditions.

After review of prior CRB well logs, the bedrock description in the vicinity of the Site is defined as fractured gneiss or schist drilled less than 5 to 10 feet below the total hollow-stem auger refusal depth using American Petroleum Institute 5DP rods and a tri-roller cone. Based on nearby Site knowledge and the Daniel and Dahlen 2002 publication, when many fractures or joints are present in the crystalline rock, this can facilitate higher water yield, allowing for higher flow through the shallower bedrock formation than the deeper, more competent bedrock formation. As such, a 10 percent porosity value has been used for the shallow bedrock velocity calculations, consistent with the Daniel and Dahlen 2002 publication.

The calculations for the average linear groundwater velocities are included in **Appendix A**.

Generally, the Site exhibits a downward flow potential, except for an upward flow potential in certain transition zone to saprolite zone well pairs (MW-1T to MW-1S, MW-4D to MW-4T, MW-9T to MW-9D, and MW-10T to MW-10I). Vertical flow potentials will continue to be assessed as more gauging data is collected at the Site, and the CSM will be revised accordingly in future reports. The vertical flow potentials based on the August 2025 gauging data is included below in **Table 3-1**.

Table 3-1: Vertical Flow Potentials

Well Pair	Static Water Level Elevations (ft)	Difference in Water Level Elevations (ft)	Flow Potential
MW-1S	876.77	-0.01	Up
MW-1T	876.78		
MW-4	871.21	0.35	Down
MW-4T	870.86		
MW-4T	870.86	-1.25	Up
MW-4D	872.11		
MW-6I	864.77	0.04	Down
MW-6T	864.73		
MW-6T	864.73	0.93	Down
MW-6D	863.80		
MW-9S	851.38	-0.80	Up
MW-9T	852.18		
MW-9T	852.18	4.22	Down
MW-9D	847.96		
MW-10I	876.42	-0.34	Up
MW-10T	876.76		

Notes:
S – shallow
I/T – transition
D – deep
ft = feet

3.3.1 Low-Flow Sampling

Monitoring wells were purged using low-flow techniques in accordance with the EPA's Operating Procedure for Low-Flow (Minimal Drawdown) Groundwater Sampling procedures, EPA/540/S-95/504. The pumping rate was limited to 0.1 to 0.5 liters per minute.

Prior to sample collection, field parameters, including pH, specific conductance, temperature, turbidity, dissolved oxygen, and oxidation-reduction potential (ORP) were measured using a Horiba U-52 multi-parameter meter equipped with a flow-through cell. Field parameters were recorded on purging and sampling logs and are summarized in **Table V**. Copies of the groundwater sampling forms are provided in **Appendix E**.

3.4 SAMPLE COLLECTION AND ANALYSIS

Once collected and properly labeled, the groundwater samples were transferred directly from the sampling device into laboratory-supplied sample containers. Each container was then placed into an ice-filled cooler for shipment to Pace under standard chain of custody procedures for VOC analysis by EPA Method 8260D.

Laboratory analyses were completed within applicable holding times for the analytical parameters and testing methods performed. Historical analytical results for target COCs, including PCE, TCE, and cis-1,2-DCE, are summarized along with the recent results on **Table VI**. Laboratory analytical reports and chain of custody documents are provided in **Appendix F**. Historical concentration for PCE versus time charts presented with water level data are provided in **Appendix G**. Comprehensive historical analytical tables are included in **Appendix H**.

3.5 SAMPLING DEVIATIONS

The following sampling deviations were encountered during the August 2025 groundwater sampling event:

- Monitoring well MW-20S and MW-21S were dry; therefore, they were not sampled.

3.6 INVESTIGATION-DERIVED WASTES

Groundwater generated during sampling was containerized in two 55-gallon steel drums and staged outside a storage shed in accordance with facility requirements for analysis and characterization for off-Site disposal. Gloves, tubing, and other disposable products were discarded as solid waste within the facility waste stream.

3.7 SAPROLITE AQUIFER GROUNDWATER CONCENTRATIONS

Twenty-two monitoring wells (MW-1S, MW-2, MW-3, MW-4, MW-5, MW-6S, MW-6I, MW-7R, MW-8, MW-9S, MW-10S, MW-10I, MW-12, MW-13, MW-14, MW-15, MW-16, MW-17, MW-23S, MW-24, MW-25, and MW-26) were sampled within the saprolite groundwater zone during the August 2025 sampling event.

As shown in **Table VI**, 11 of the 22 monitoring wells sampled within the saprolite groundwater zone (MW-5, MW-6S, MW-6I, MW-7R, MW-8, MW-9S, MW-10S, MW-10I, MW-14, duplicate sample at

MW-15, and MW-17) had detections of PCE above the MCL. **Figure 8** depicts the interpreted plume geometry of PCE in the saprolite groundwater zone wells for the August 2025 sampling event.

PCE concentrations have remained stable and below the MCL or non-detect in wells MW-1S, MW-1T, MW-2, MW-3, MW-4, MW-10T, MW-12, MW-13, MW-16, MW-20S, and MW-23S during recent sampling events. PCE was below the MCL or non-detect for the supplemental monitoring wells, MW-24, MW-25, and MW-26. PCE concentrations have increased slightly since the baseline August 2023 sampling event for wells MW-5, MW-6S, MW-6I, MW-8, MW-9S, MW-10S, MW-10I, MW-14, MW-15, and MW-17; however, these wells remain within historical ranges. Monitoring well MW-7 was previously abandoned and replaced with MW-7R. Following installation, the replacement monitoring well (MW-7R) was first sampled as part of the fall 2024 sampling event with a result of 65 µg/L. A PCE concentration of 29.3 µg/L was detected in the groundwater sampled from MW-7R in August 2025, which is within historical range (at previous MW-7). Monitoring well MW-7R will continue to be sampled and the trends monitored during future sampling events.

Degradation products, including TCE, cis-1,2-DCE, and vinyl chloride, were not detected above their respective MCLs during the August 2025 sampling event, except for cis-1,2-DCE at MW-10S. The compound 1,1-dichloroethane was detected above the MCL at MW-14.

3.8 TRANSITION GROUNDWATER CONCENTRATIONS

Seven monitoring wells (MW-1T, MW-4T, MW-6T, MW-9T [interpreted to span the intermediate and transition groundwater zones], MW-10T, MW-20T, and MW-21T) were sampled within the transition groundwater zone during the August 2025 sampling event.

As shown in **Table VI**, three of the seven monitoring wells sampled within the transition groundwater zone (MW-4T, MW-6T, and MW-9T) had detections of PCE above the MCL. **Figure 9** depicts the interpreted plume geometry distribution of PCE in the transition groundwater zone wells for the August 2025 sampling event.

PCE concentrations have remained non-detect or below the MCL in wells MW-1T and MW-20T since the 2013 and 2017 sampling events, respectively. PCE concentrations have fluctuated at MW-21T but were detected at an estimated value of 0.857 µg/L in August 2025.

PCE concentrations have increased slightly at monitoring wells MW-4T, MW-6T, and MW-9T and remain above the MCL. Concentrations have generally fluctuated up and down during historical sampling events. PCE concentrations at monitoring well MW-10T historically have been below reporting limits; however, following the Enhanced Reductive Dechlorination injection event in October 2023, detections of PCE ranged from an estimated concentration of 0.312 µg/L (November 2023) to 127 µg/L (March 2024). PCE concentrations at monitoring well MW-10T have been either below reporting limits or below the MCL since the September 2024 event.

Degradation products, including TCE, cis-1,2-DCE, and vinyl chloride, were not detected above their respective MCLs during the August 2025 sampling event.

3.9 DEEP (BEDROCK) GROUNDWATER CONCENTRATIONS

Three monitoring wells (MW-4D, MW-6D, and MW-9D) were sampled within the deep groundwater zone during the August 2025 sampling event. As shown in **Table VI**, one of the three monitoring wells (MW-9D) sampled within the deep groundwater zone had a detection of PCE slightly above its respective MCL. **Figure 10** depicts the interpreted plume geometry of PCE in the bedrock groundwater zone wells.

Historical concentration trends show that well MW-4D has been stable with no detection of PCE since 2013. Wells MW-6D and MW-9D both have had fluctuating PCE concentrations since the August 2023 sampling event, but these remain within historical ranges. Degradation products, including TCE, cis-1,2-DCE, and vinyl chloride, were not detected above their respective MCLs during the August 2025 sampling event.

4. Summary of Surface Water Activities and Results

4.1 SURFACE WATER SAMPLING ACTIVITIES

Surface water samples were collected on August 15, 2025, from the same eight locations along the Unnamed Creek. Surface water samples (SW-1 through SW-8) were collected as grab samples. Field parameters, including pH, specific conductance, temperature, turbidity, dissolved oxygen, and ORP, were measured using a HORIBA U-52 multi-parameter meter. Copies of the surface water sampling forms are provided in **Appendix E**. Once collected in laboratory-supplied containers, each sample was submitted in an ice-filled cooler to Pace for VOC analysis by EPA Method 8260D. One duplicate sample was collected from the surface water location (SW-6).

4.2 SURFACE WATER SAMPLING RESULTS

Analytical results from December 2024, March 2025, and August 2025 sampling events are presented in **Table VII**. PCE concentrations for the August 2025 sampling event are shown on **Figure 8**. Laboratory analytical reports and chain of custody documents are provided in **Appendix F**.

Detections of VOCs were below their respective MCLs in each of the eight samples. Five of the eight surface water locations samples (SW-2, SW-3, SW-6, SW-7, and SW-8) had detections of PCE. Two locations (SW-3 and SW-6) had detections of cis-1,2-dichloroethene, a daughter product of PCE. In addition, toluene was detected in SW-4 and 1,1,2-trichlorotrifluoroethane was detected in SW-3 and SW-8. Two locations (SW-4 and SW-6) had a detection of 2-propanol. Analytical results in the duplicate sample are generally consistent with the results of the primary surface water sample (SW-6), indicating the sample results are valid and usable.

5. Data Validation and Analysis

5.1 DATA VALIDATION PROCEDURES

Following completion of the field investigations and receipt of final analytical reports, the collected data were validated. The validation process concluded that the dataset is reliable. Completeness checks were administered on all data to determine that the required laboratory deliverables were provided.

One hundred percent of the data was validated for Level II criteria that included:

- Holding Time/Preservation
- Method/Preparation Blanks
- Trip Blanks
- Deuterated Monitoring Compounds/Surrogates
- Laboratory Control/Laboratory Control Duplicate Samples
- Field/Laboratory Duplicates
- Matrix Spike/Matrix Spike Duplicate Samples

Validation of the analytical data was performed by data validation staff based on the evaluation criteria outlined in the *National Functional Guidelines for Organic Superfund Methods Data Review* and the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (EPA, 2020a and 2020b). The validation included a review of each validation criterion, as prescribed by the guidelines. The data verification/validation procedure was used to identify data as being acceptable, of limited usability (qualified as estimated), or rejected.

5.2 SUMMARY OF DATA VALIDATION

5.2.1 Soil

Based on the Level II validation of the August 2025 soil sampling of the supplemental monitoring wells, qualifiers were not included for soil samples.

5.2.2 Sub-Slab Soil Gas and Soil Vapor Extraction System Wells

The following qualifier was noted during the Level II validation for the August 2025 sampling event:

- One record (VP-14 for vinyl acetate) was applied due to high laboratory control sample and duplicate (LCS/LCDS) recovery percentage difference of 134 percent, LCS/LCDS analysis are used to assess the precision and accuracy of the analytical method independent of matrix interferences. A qualifier was included for quality control concerns since the precision or accuracy of the result could not be guaranteed.

Overall, the data collected and included in this Report were within acceptable values for the August 2025 sampling event. Based on the Level II validation, the data are useable and acceptable.

5.2.3 Groundwater and Surface Water

The following qualifiers were noted during the Level II validation for the August 2025 sampling event:

- Two records (MW-15 and its duplicate sample for PCE) were applied due to the absolute difference between the parent and duplicate samples. The absolute difference was greater than reporting limit for the analysis; therefore, a qualifier was included for the parent and duplicate results.

Overall, the data collected and included in this Report were within acceptable values. Based on the Level II validation, the data are useable and acceptable.

6. Quality Assurance/Quality Control Results

6.1 GROUNDWATER AND SURFACE WATER

QA/QC samples collected and submitted for analysis consisted of two duplicates for groundwater, one duplicate for surface water, and one trip blank sample. Analytical reports and chain of custody documentation for samples are presented in **Appendix F**.

6.1.1 Duplicate Samples

Two groundwater duplicate samples were collected concurrently with the samples from MW-1S and MW-15. The surface water duplicate sample was collected concurrently with the sample from SW-6. Analytical results are generally consistent with the results of the primary groundwater and surface water samples.

6.1.2 Method/Trip Blanks

Method blank samples prepared by the laboratory and analyzed concurrently with the groundwater samples to assess the possibility of laboratory contamination. Method blank samples had no detections, indicating that no contamination from laboratory activities occurred.

Trip blanks were placed in coolers that contained groundwater. One trip blank was submitted to Pace under standard chain of custody procedures for VOC analysis by EPA Method 8260D.

No target compounds were detected in trip blank samples; and therefore, the samples were not subject to cross-contamination during shipment.

7. Conclusions and Recommendations

Based on monitoring activities completed, the following provides our conclusions and recommendations.

7.1 SUB-SLAB SOIL GAS

Based on the sub-slab soil gas assessment conducted in August 2025, the VOC concentrations detected in the soil gas samples collected from the 16 Vapor Pins® were below the EPA's commercial VISLs, except for PCE at four locations in the northwestern portion of the building (VP-11, VP-12, VP-15, and VP-16). These results are consistent with the previous sub-slab soil gas sampling results and the passive soil gas results for PCE. TCE was detected above the commercial VISL at one location near the former back wall of the original building footprint (VP-6); however, as discussed in Section 2.2.2, the TCE result for VP-6 is considered an outlier and is not representative of actual conditions, as previous results for TCE at VP-6 have been non-detect.

To continue assessing the effectiveness of the system and trends, additional sampling of the Vapor Pins® near the SSDS/SVE system, individual extraction well locations, and SSDS/SVE exhaust will be conducted during the fourth quarter of 2025.

7.2 SOIL VAPOR EXTRACTION SYSTEM SAMPLING

Between August 2023 and July 2025, a total PCE mass removed was calculated to be 7.0 lbs. Detected concentrations of PCE indicate continued removal of sub-slab impacts via the SVE system. Quarterly O&M sampling of the SSDS/SVE effluent is proposed to continue and will be incorporated into the regular SCDES status reports. During quarterly sampling events, select Vapor Pins® near the SVE extraction wells and individual extraction wells (SVE-EW-1 though SVE-EW-4) will be sampled and differential pressure readings collected. Vacuum and air flow readings will be collected from each individual extraction well and the combined system effluent. Vacuum readings at the individual well heads will be collected.

7.3 GROUNDWATER

Based on the groundwater sampling results at the Site between October 2023 and August 2025, the analytical results are generally consistent and the plume configuration appears stable. Based on the results from the August 2025 sampling event, PCE concentrations were either historically below the respective MCL or appear to have decreasing trends to below the respective MCL in the following 14 of the 32 monitoring wells sampled during the event:

- Monitoring wells within saprolite zone: MW-1S, MW-1T, MW-2, MW-3, MW-4, MW-10T, MW-12, MW-13, MW-16, MW-20S, and MW-23S;
- Monitoring wells with transition zone: MW-1T and MW-20T; and
- Monitoring well with deep (bedrock) zone: MW-4D.

Slight increase in PCE concentrations were observed since the August 2023 baseline sampling event at the following wells, but concentrations remain within historical ranges:

- Monitoring wells within saprolite zone: MW-5, MW-6S, MW-6I, MW-8, MW-9S, MW-10S, MW-10I, MW-14, MW-15 and MW-17;

- Monitoring wells with transition zone: MW-4T, MW-6T and MW-9T; and
- Monitoring well with deep (bedrock) zone: MW-6D and MW-9D.

Monitoring well MW-7 was abandoned and replaced with MW-7R, which will continue to be monitoring as part of the Site-wide sampling events. Historical PCE concentrations at MW-15 have fluctuated but remain within historical ranges, indicating that the plume appears stable. PCE concentrations at MW-10S, MW-10T, and MW-10I have fluctuated following the August 2023 sampling event potentially due to PCE partitioning into the enhanced reductive dechlorination amendment.

Haley & Aldrich recommends collecting additional groundwater samples from the Site-wide network, including the new supplemental monitoring wells in the spring of 2026.

7.4 SURFACE WATER

Based on the surface water sampling event completed in August 2025, detections of VOCs were below their respective SCDES MCLs in each of the eight samples collected from the Unnamed Creek. Several VOCs were detected in one or more surface water locations, including primarily PCE, and to a lesser extent cis-1,2-DCE, 1,1,2-trichlorotrifluoroethane, and 2-propanol.

In accordance with SCDES's response letter dated June 23, 2025, regarding the *March 2025 Site Groundwater and Surface Water Monitoring Report*, annual surface water sampling is required until a remedy is selected.

7.5 RECOMMENDATIONS

Based on the completion of the supplemental investigations and continued groundwater monitoring since August 2023, we recommend the following:

- Perform the next Site-wide groundwater monitoring event in spring 2026.
- If the remedy has not been selected by the next Site-wide groundwater monitoring event, surface water samples will be collected. If the remedy has been selected, surface water samples will not be collected.
- Continue quarterly SSDS/SVE and select Vapor Pin® sampling near the SVE well points to evaluate system performance and trends. Data will be reported in future progress reports and integrated into the FS Report.

Notes and Abbreviations:

Depth in feet below land surface; elevation in feet above sea level National Geodetic Vertical Datum 1983

DTW: Depth to Water

in.: inches

TIC: Top of Inner Casing

TBD: to be determined

1 - Top of Inner Casing elevation in feet relative to building slab elevation of 900 feet.

2 - MW-1 was renamed MW-1T as part of the MW-1 cluster

3 - MW-11D was renamed MW-4D as part of the MW-4 cluster

4 - MW-6 was plugged to a depth of 31.0 feet and renamed MW-6S as part of the MW-6 cluster

5 - MW-7 was abandoned and replaced in May 2024 with MW-7R

6 - MW-9 was plugged to a depth of 21.0 feet and renamed MW-9S as part of the MW-9 cluster

7 - MW-10 was plugged to a depth of 23.6 feet and renamed MW-10S as part of the MW-10 cluster

Monitoring Well Cluster Screen Designations

I - Intermediate Zone water-bearing depth above Transition Zone

T - Transition Zone water-bearing depth at the saprolite / bedrock boundary

D - Deep Zone, bedrock water-bearing depth

TABLE IV
SUMMARY OF GROUNDWATER ELEVATIONS – AUGUST 2025
WOVEN ELECTRONICS, LLC
1001 OLD STAGE ROAD
SIMPSONVILLE, SOUTH CAROLINA

Well Identifier	Geological Unit	Date of Measurement	Reference Point Elevation (feet above MSL)	Depth to Water (feet)	Static Water Level Elevation (feet above MSL)
MW-1S	Saprolite	8/11/2025	895.82	19.05	876.77
MW-1T [2]	Transition	8/11/2025	895.74	18.96	876.78
MW-2	Saprolite	8/11/2025	894.91	20.43	874.48
MW-3	Saprolite	8/11/2025	892.99	21.10	871.89
MW-4	Saprolite	8/11/2025	889.78	18.57	871.21
MW-4D [3]	Bedrock	8/11/2025	889.85	17.74	872.11
MW-4T	Transition	8/11/2025	889.87	19.01	870.86
MW-5	Saprolite	8/11/2025	891.83	26.06	865.77
MW-6D	Bedrock	8/11/2025	890.19	26.39	863.80
MW-6I	Saprolite	8/12/2025	890.49	25.42	865.07
MW-6S [4]	Saprolite	8/11/2025	889.97	25.86	864.11
MW-6T	Transition	8/11/2025	890.63	25.90	864.73
MW-7R	Saprolite	8/11/2025	889.92	27.35	862.57
MW-8	Saprolite	8/11/2025	889.51	27.16	862.35
MW-9D	Bedrock	8/11/2025	862.04	14.08	847.96

MW-12	Saprolite	8/11/2025	899.71	17.11	882.60
MW-13	Saprolite	8/11/2025	891.27	22.08	869.19
MW-14	Saprolite	8/11/2025	891.14	22.56	868.58
MW-15 [7]	Saprolite	8/11/2025	854.13	17.05	837.08
MW-16	Saprolite	8/11/2025	883.68	26.86	856.82
MW-17	Saprolite	8/11/2025	899.70	21.41	878.29
MW-20S [8]	Saprolite	8/11/2025	899.58	Dry	Dry
MW-20T	Transition	8/11/2025	899.59	18.11	881.48
MW-21S	Saprolite	8/11/2025	881.52	Dry	Dry
MW-21T	Transition	8/11/2025	881.59	31.00	850.59
MW-23S	Saprolite	8/11/2025	899.00	23.70	875.30
MW-24	Saprolite	8/11/2025	897.76	13.46	884.30
MW-25	Saprolite	8/11/2025	896.28	14.92	881.36
MW-26	Saprolite	8/11/2025	889.12	24.15	864.97

Notes and Abbreviations:

NM: No measurement
MSL: mean sea level
TBD: to be determined
Monitoring Well Cluster Screen Designations
S/I - Saprolite Zone water table or uppermost water-bearing depth
T - Transition Zone water-bearing depth at the saprolite / bedrock boundary
D - Deep Zone, bedrock water-bearing depth
[1] - Top of Inner Casing (TIC) elevation in feet relative to the building slab benchmark of 900 feet.
[2] - MW-1 was renamed MW-1T as part of the MW-1 cluster
[3] - MW-11D was renamed MW-4D as part of the MW-4 cluster
[4] - MW-6 was plugged to a depth of 31.0 feet and renamed MW-6S as part of the MW-6 cluster
[5] - MW-9 was plugged to a depth of 21.0 feet and renamed MW-9S as part of the MW-9 cluster
[6] - MW-10 was plugged to a depth of 23.6 feet and renamed MW-10S as part of the MW-10 cluster
[7] - MW-15 was plugged to a depth of 16.52 based on the depth to water measured during the fall 2024 monitoring event.
[8] - Angled well

Notes and Abbreviations:

Data collected prior to August 2023 was completed by CRB
"-": Not analyzed or comparison criteria not established
<: less then the detection limit
bgs: below ground surface
µg/L: micrograms per liter
PDB: Passive Diffusion Bag Sample (depth in feet)
MCL: Maximum Contaminant Level
RSL: Regional Screening Level (November 2024)
EPA: U.S. Environmental Protection Agency
***Bold** results are detected*
Results shaded in blue are detected above the MCL
**MCL is not available and therefore the detected results are compared to the RSL*
PCE - Tetrachloroethene
DCE - Dichloroethene
DCA - Dichloroethane
TCE - Trichloroethene

Oxidation-Reduction Potential (ORP), Field (mv)	-	173	266	378	145	216	321
Turbidity, Field (NTU)	-	2.8	2.2	12.7	0.7	0	8.1
pH, Field (pH units)	-	5.53	4.88	4.27	5.93	5.08	4.67

Notes and Abbreviations:
Results in ***bold*** *are detected.*
Results shaded in blue are detected above the MCL.
<: Not detected above the indicated reporting limit.
J: Estimated result
MCL: Maximum Contaminant Level
µg/L: micrograms per liter
Deg C: degrees celsius
mg/L: milligrams per liter
mS/cm: millisiemens per centimeter
mV: millivolt
NTU: Nephelometric Turbidity Units

APPENDIX A
Linear Velocity Calculations

HALEY ALDRICH

GROUNDWATER VELOCITY CALCULATIONS

File No.: 0208312-008
Sheet: 1 of 1

Client:	RTX
Project:	Woven Electronics LLC - Simpsonville, SC
Subject:	August 2025 Groundwater Velocity Calculations
Date:	1-Oct-2025
Computed by:	
Checked by:	

EQUATIONS

Variables

1. K = Hydraulic Conductivity, ft/day
2. Dh/Dl = Hydraulic Gradient, unitless
3. N_e = Effective Porosity, unitless
4. V_x = Groundwater Velocity, ft/day

$$Vx = -K \frac{Dh}{Dl * Ne}$$

SUMMARY TABLE

Method	Estimated K (ft/day)	Gradient (unitless)	Effective Porosity (unitless)	Groundwater Flow Velocity (ft/day)	Groundwater Flow Velocity (ft/year)
Saprolite	5.00	2.95E-02	0.25	0.5902	215
Transition	1.00	2.17E-02	0.25	0.0868	32
Bedrock	0.800	4.54E-02	0.10	0.3629	132

Hydraulic gradient values calculated based on gauging data from August 2025.

1. WELL OWNER INFORMATION:
Name: Woven Electronics (last) (first)
Address: 1001 Old Stage Road
City: Simpsonville State: SC Zip: 29681
Telephone: Work: Home:

2. LOCATION OF WELL: COUNTY: Greenville
Name: Woven Electronics
Street Address: 1001 Old Stage Road
City: Simpsonville Zip: 29681
Latitude: Longitude:

3. PUBLIC SYSTEM NAME: PUBLIC SYSTEM NUMBER: MW-24

4. ABANDONMENT: ☐ Yes ☒ No
Give Details Below
Grouted Depth: from _____ ft. to _____ ft.

Formation Description	*Thickness of Stratum	Depth to Bottom of Stratum
*Indicate Water Bearing Zones (Use a 2nd sheet if needed)		

5. REMARKS: Bentonite seal from 20'-23'.

6. TYPE: ☐ Mud Rotary ☐ Jetted ☐ Bored ☐ Dug ☐ Air Rotary ☒ Driven ☐ Cable tool ☐ Other

7. PERMIT NUMBER: SARRMW-00707v1.0

8. USE: ☐ Residential ☐ Public Supply ☐ Process ☐ Irrigation ☐ Air Conditioning ☐ Emergency ☐ Test Well ☒ Monitor Well ☐ Replacement

9. WELL DEPTH (completed) 35 ft. Date Started: 8-4-2025 Date Completed: 8-4-2025

10. CASING: ☒ Threaded ☐ Welded
Diam.: 2
Type: ☒ PVC ☐ Galvanized ☐ Steel ☐ Other
0 in. to 25 ft. depth
_____ in. to _____ ft. depth
Height: Above/(Below)
Surface _____ ft.
Weight _____ lb./ft.
Drive Shoe? ☐ Yes ☒ No

11. SCREEN:
Type: SCH 40 PVC Diam.: 2
Slot/Gauge: 0.010 Length: 10
Set Between: 25 ft. and 35 ft.
_____ ft. and _____ ft.
NOTE: MULTIPLE SCREENS USE SECOND SHEET
Sieve Analysis ☐ Yes (please enclose) ☒ No

12. STATIC WATER LEVEL N/A ft. below land surface after 24 hours

13. PUMPING LEVEL Below Land Surface.
_____ ft. after _____ hrs. Pumping _____ G.P.M.
Pumping Test: ☐ Yes (please enclose) ☒ No
Yield: _____

14. WATER QUALITY
Chemical Analysis ☐ Yes ☒ No Bacterial Analysis ☐ Yes ☒ No
Please enclose lab results.

15. ARTIFICIAL FILTER (filter pack) ☒ Yes ☐ No
Installed from 23 ft. to 35 ft.
Effective size #2 Uniformity Coefficient _____

16. WELL GROUTED? ☒ Yes ☐ No
☒ Neat Cement ☐ Bentonite ☐ Bentonite/Cement ☐ Other _____
Depth: From 0 ft. to 20 ft.

17. NEAREST SOURCE OF POSSIBLE CONTAMINATION: _____ ft. _____ direction
Type _____
Well Disinfected ☐ Yes ☒ No Type: _____ Amount: _____

18. PUMP: Date installed: _____ Not installed ☒
Mfr. Name: _____ Model No.: _____
H.P._____ Volts_____ Length of drop pipe_____ ft. Capacity ____ gpm
TYPE: ☐ Submersible ☐ Jet (shallow) ☐ Turbine ☐ Jet (deep) ☐ Reciprocating ☐ Centrifugal

SITE NAME: Collins Aerospace
Monitoring Well Survey Report
Surveyed by: Taylor Wiseman & Taylor
Project: #07525.6101.01
Date of Survey: 09/05/2025
Horizontal Datum: NAD83 SCSPCS Zone 2900 (NA 2011)
Vertical Datum: NAVD88 (Geoid 18)
Combined Scale Factor = 0.99993416 (PT #100)
Units: International Feet

Site Location: 1001 Old Stage Road, Simpsonville, SC

CONTROL LINE

CONTROL	NORTHING	EASTING	ELEVATION
100	1064170.591	1617969.973	892.53
101	1064341.981	1618371.624	898.88

WELL TABLE

WELL / SAMPLE ID	NORTHING	EASTING	TOP OF CASE ELEVATION	GROUND ELEVATION
MW-24	1064709.164	1618116.011	897.76	898.11
MW-25	1064798.653	1617998.102	896.28	896.63
MW-26	1064032.772	1617851.162	889.12	886.33

Survey Notes:
All coordinates shown hereon are based upon the South Carolina State Plane Coordinate System, NAD83 (NA 2011), with NAVD88 (Geoid 18) elevations, per a GPS survey performed by Taylor Wiseman & Taylor on April 9, 2025. The two points shown hereon were established utilizing global positioning systems (GPS) in conjunction with the South Carolina Geodetic Survey's Virtual Reference System (VRS), which is based upon the Continually Operating Reference Stations (CORS). A Trimble R10 receiver was utilized for the GPS survey. All wells were surveyed conventionally off of the control line with a Trimble S6 robotic total station. All coordinates are as shown.

Survey Certification:

I, James M. Pearsall, hereby certify that the coordinates shown above are accurate to best of my knowledge, information and belief. Witness my seal and signature this 9th day of September 2025, AD.

HALEY ALDRICH

LOW-FLOW SAMPLING FIELD FORM

Monitoring Well I.D.: MW-45	Date: 8/12/25	Time Started: 1125	File Number: 0208312.
Weather Conditions: Cloudy 70s		Time Ended: 1200	Field Personnel: T. Vaughan

Initial Readings

Estimated Well Bottom (TOR-ft)		Estimated Screen Interval (TOR-ft)	17-47
Measured Well Bottom (TOR-ft)	45.58	Riser Pipe Diameter (in.)	1
Measured Water Level (TOR-ft)	18.56	PID background (ppm)	–
Notes:		PID headspace (ppm)	–

Well Condition

Well Riser Type (place an X in one box)			Stainless Steel		Carbon Steel	X	PVC
Casing Condition:	OK	✓	Repair Required:				
Cap Condition:	OK	✓	Repair Required:				
Paint Condition:	OK	✓	Repair Required:				
Lock Condition:	OK	✓	Repair Required:				
Inner Casing Condition:	OK	✓	Repair Required:				
Surface Seal Condition:	OK	✓	Repair Required:				
Other:	OK	✓	Repair Required:				

Purge Information

Purging Method:	X	Peristaltic Pump		Bladder Pump		Grundfos Pump	Other:
Purge Start Time:	1125						
Water Level Prior to Purging (TOR ft.)	18.56			Water Level After Purging (TOR ft.)			
Amount Purged:	3850mL			Flow Rate (mL per minute):	150mL/min → 100mL/min		
Comments:							

Time	Temperature (deg C) +/-0.5	pH +/-0.2	Conductivity (mS/cm) +/-3%	Turbidity (NTUs) +/-10%	Dissolved Oxygen (mg/L) +/-0.2 or 10%	Redox (ORP) +/-20	Water Level (TOR ft) +/-0.1	Comments

JOB DESCRIPTION

Woven Electronics

JOB NUMBER

410-235550-1

Eurofins Lancaster Laboratories Environment Testing, LLC
2425 New Holland Pike
Lancaster PA 17601

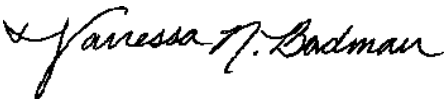

See page two for job notes and contact information.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Authorization

Generated
8/6/2025 9:50:29 AM

Authorized for release by
Vanessa Badman, Project Manager
Vanessa.Badman@et.eurofinsus.com
(717)556-9762

Compliance Statement

Analytical test results meet all requirements of the associated regulatory program (e.g., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis. Data qualifiers are applied to note exceptions. Noncompliant quality control (QC) is further explained in narrative comments.
· QC results that exceed the upper limits and are associated with non-detect samples are qualified but further narration is not required since the bias is high and does not change a non-detect result. Further narration is also not required with QC blank detection when the associated sample concentration is non-detect or more than ten times the level in the blank.
· Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD is performed, unless otherwise specified in the method.
· Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.
Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" and tested in the laboratory are not performed within 15 minutes of collection.

This report shall not be reproduced except in full, without the written approval of the laboratory.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. The foregoing express warranty is exclusive and is given in lieu of all other warranties, expressed or implied, except as otherwise agreed. We disclaim any other warranties, expressed or implied, including a warranty of fitness for particular purpose and warranty of merchantability. In no event shall Eurofins Lancaster Laboratories Environmental, LLC be liable for indirect, special, consequential, or incidental damages including, but not limited to, damages for loss of profit or goodwill regardless of (A) the negligence (either sole or concurrent) of Eurofins Lancaster Laboratories Environmental and (B) whether Eurofins Lancaster Laboratories Environmental has been informed of the possibility of such damages. We accept no legal responsibility for the purposes for which the client uses the test results. Except as otherwise agreed, no purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Definitions/Glossary

Client: Haley & Aldrich, Inc.
Project/Site: Woven Electronics

Job ID: 410-235550-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
cn	Refer to Case Narrative for further detail
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
410-235550-1

The analytical test results presented in this report meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page, unless otherwise noted. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable. Regulated compliance samples (e.g. SDWA, NPDES) must comply with associated agency requirements/permits.

- Matrix-specific batch QC (e.g., MS, MSD, SD) may not be reported when insufficient sample volume is available or when site-specific QC samples are not submitted. In such cases, a Laboratory Control Sample Duplicate (LCSD) may be analyzed to provide precision data for the batch.
- For samples analyzed using surrogate and/or isotope dilution analytes, any recoveries falling outside of established acceptance criteria are re-prepared and/or re-analyzed to confirm results, unless the deviation is due to sample dilution or otherwise explained in the case narrative.

Receipt
The sample was received on 8/5/2025 8:45 AM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.2°C.

Receipt Exceptions
The Chain-of-Custody (COC) was incomplete as received. The COC is missing the sample state, number of containers per sample and sample preservation. This does not meet regulatory requirements.

A trip blank was not submitted for analysis with this sample shipment; and was not listed on the Chain of Custody (COC).

GC/MS VOA
Method 8260D: The continuing calibration verification (CCV) associated with batch 410-681156 recovered above the upper control limit for Chloromethane, Dichlorodifluoromethane and Isopropylbenzene. Non-detections of the affected analytes are reported. Any detections are considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Question	Answer	Comment
The cooler's custody seal is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature acceptable,where thermal pres is required(</=6C, not frozen).	True	
Cooler Temperature is recorded.	True	
WV:Container Temp acceptable,where thermal pres is required (</=6C, not frozen).	N/A	
WV: Container Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	Refer to Job Narrative for details.
There are no discrepancies between the containers received and the COC.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses.	True	
Is the Field Sampler's name present on COC?	True	
Sample custody seals are intact.	N/A	
VOA sample vials do not have headspace >6mm in diameter (none, if from WV)?	True	

ANALYTICAL REPORT

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Chris McCord
Project Manager

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
U (Radiochemistry)	Result + Error < MDA.
J (Radiochemistry)	Result < MDA; Result + Error > MDA.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Chris McCord
Project Manager

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
U (Radiochemistry)	Result + Error < MDA.
J (Radiochemistry)	Result < MDA; Result + Error > MDA.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
C5	The reported concentration is an estimate. The continuing calibration standard associated with this data responded high. Data is likely to show a high bias concerning the result.
J	The identification of the analyte is acceptable; the reported value is an estimate.
J4	The associated batch QC was outside the established quality control range for accuracy.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Chris McCord

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
U (Radiochemistry)	Result + Error < MDA.
J (Radiochemistry)	Result < MDA; Result + Error > MDA.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
J1	Surrogate recovery limits have been exceeded; values are outside upper control limits.
J4	The associated batch QC was outside the established quality control range for accuracy.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Chris McCord
Project Manager

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
U (Radiochemistry)	Result + Error < MDA.
J (Radiochemistry)	Result < MDA; Result + Error > MDA.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
J4	The associated batch QC was outside the established quality control range for accuracy.

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
U (Radiochemistry)	Result + Error < MDA.
J (Radiochemistry)	Result < MDA; Result + Error > MDA.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
J4	The associated batch QC was outside the established quality control range for accuracy.

Due on *20 August 2025 5:00 PM* for target *Done*

- [ ] Parameter(s) past holding time
- [ ] Temperature not in range
- [ ] Improper container type
- [ ] pH not in range
- [x] Insufficient sample volume
- [ ] Sample is biphasic
- [ ] Vials received with headspace
- [ ] Broken container
- [ ] Sufficient sample remains
- [ ] If broken container: Insufficient packing material around container
- [ ] If broken container: Insufficient packing material inside cooler
- [ ] If broken container: Improper handling by carrier:_____
- [ ] If broken container: Sample was frozen
- [ ] If broken container: Container lid not intact
- [ ] Client informed by Call

Comments

Paul Minnich *16 August 2025 11:21 PM*

Missing trip blank. Only one trip blank received in cooler and it is logged to L1889617

Christopher McCord *18 August 2025 12:05 PM*

Client notified.

ANALYTICAL REPORT

August 13, 2025

Haley & Aldrich-Greenville, SC

Sample Delivery Group:	L1884459
Samples Received:	08/02/2025
Project Number:	0208312-006
Description:	Raytheon Woven Electronics

Report To:

Montgomery Spillane
400 Augusta St.
Suite 100
Greenville, SC 29601

Entire Report Reviewed By:

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Chris McCord
Project Manager

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
U (Radiochemistry)	Result + Error < MDA.
J (Radiochemistry)	Result < MDA; Result + Error > MDA.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J4	The associated batch QC was outside the established quality control range for accuracy.

Comments

Jeremy Watkins *2 August 2025 12:17 PM*

Recieved sample labeled 20250731-DUP-01 not on COC. Pressure is -15

Christopher McCord *4 August 2025 2:33 PM*

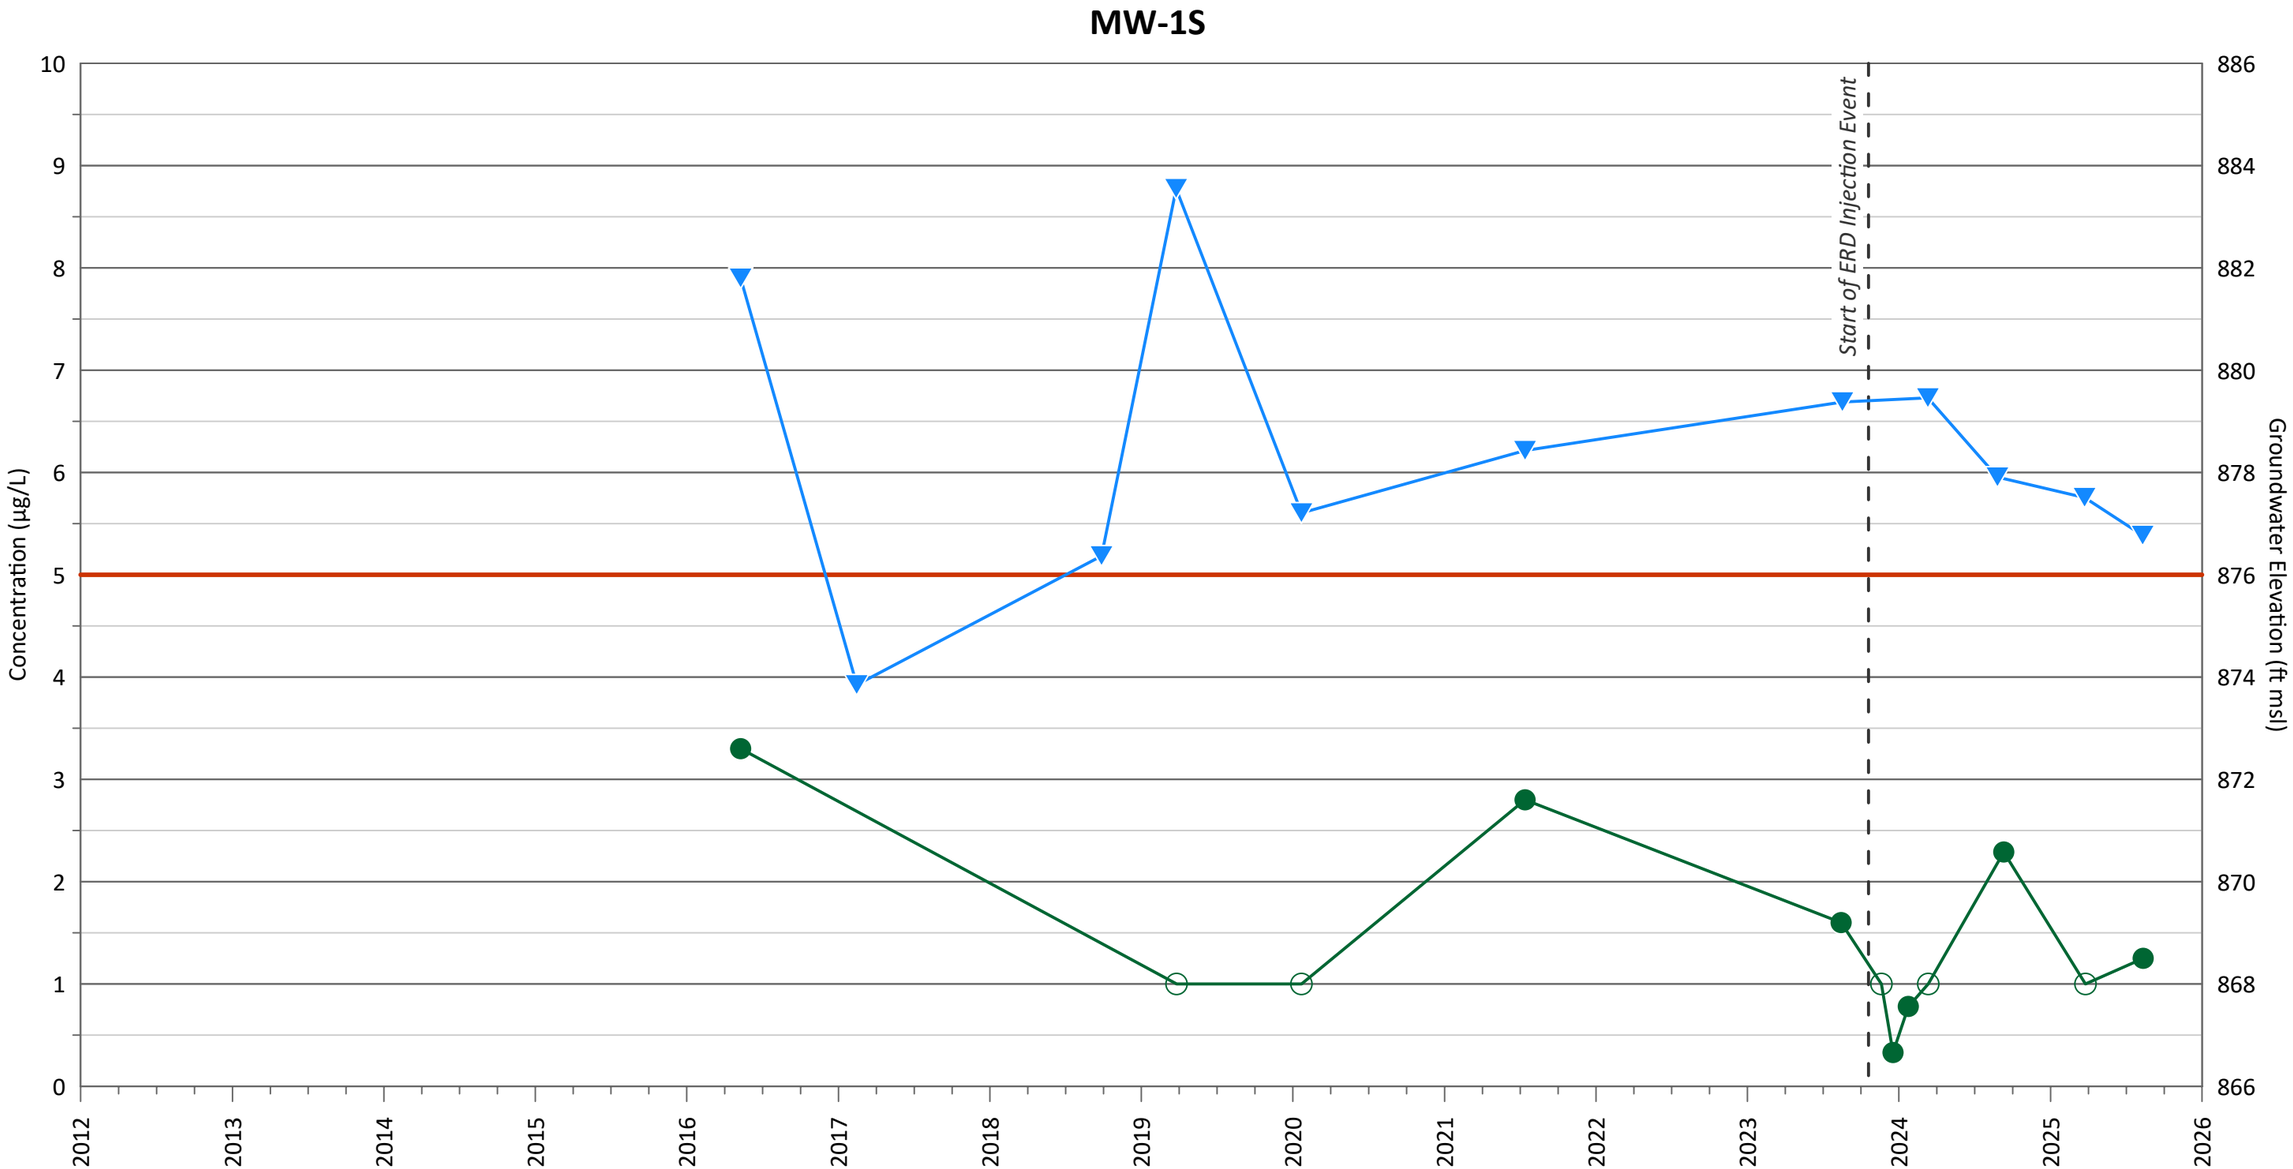

Sample does not need to be analyzed.

Troy Dunlap *4 August 2025 3:46 PM*

Done.

APPENDIX G
Historical Concentration and Water Levels versus Time Charts

Notes and Abbreviations:

*1. Results in **bold** are detected.*

2. <: Not detected above the indicated reporting limit.

3. J: Estimated result

J+: Estimated result, biased high

J-: Estimated result, biased low

R: Rejected during validation

H1, H3: Analyzed past the hold time

J0, J3, J4: Estimated result

N2: The lab does not hold NELAC/TNI accreditation for this parameter.

4. Detected results were compared to the following criteria. Results detected above criteria are flagged in [ ] and shaded in blue.

[A]: US EPA Maximum Contaminant Level (MCL)

[B]: US EPA Tapwater Regional Screening Level (RSL), November 2024

5. Data shown prior to August 2023 was collect by CRB.
